## Executive Summary

The Wisconsin Highway 81 (WIS 81) corridor study evaluates traffic operations, traffic safety, roadway access, and multimodal accommodations within the City of Beloit, Wisconsin. This report documents the methodologies, findings, and recommended mitigation strategies to improve traffic safety and facilitate acceptable traffic operations at key locations in the study area for existing-year (Year 2022) and future-year (Year 2047) conditions. A review of the existing roadway and intersection geometrics was performed to identify substandard elements along the corridor. Crash data was obtained and analyzed at study intersections and crash commonalities were identified. Traffic operations analysis was performed at key intersections along WIS 81 to evaluate current and projected traffic conditions along the project corridor.

Alternatives for the WIS 81 corridor were developed based on deficiencies found in the following categories: geometric site reviews of the study area, safety evaluation of the WIS 81 corridor and the study intersections, and intersection operations analysis for the existing-year and Year 2047 horizon year. Locations with several alternatives were evaluated based on the aforementioned categories and a preferred alternative was selected based on those results.
The following describes recommendations for the WIS 81 corridor and key intersections:
WIS 81 (Liberty Avenue), Madison Road to Fourth Street

- It is recommended that the Liberty Avenue cross-section be updated to provide a threelane cross-section with two travel lanes and a two-way, left-turn lane (TWLTL) with a multi-use path replacing one sidewalk. This alternative improves both safety and mobility as the TWLTL will allow left-turning vehicles to store and complete their turning movement to and from Liberty Avenue. The multi-use path will enhance bike/ped accommodations along the corridor and provide a vital east-west route connecting western Beloit to the downtown area. These improvements can be accommodated within the existing roadway cross-section and right of way, minimizing construction costs and right of way acquisition.
- It is recommended that access management strategies are considered for implementation along the Liberty Avenue corridor. Strategies such as consolidation, cross-access, restriction, or removal of access to Liberty Avenue will improve safety and mobility by reducing the number of access drives and conflict points which motorists must consider when driving along the roadway. Restriction or removal of public roadway access to Liberty Avenue should be investigated further to determine candidate locations. If locations are determined, crossing elements at these restricted intersections should be implemented to improve bike/ped safety when crossing Liberty Avenue.

## WIS 81 (Liberty Avenue), Sixth Street intersection

- It is recommended that the intersection control at Sixth Street be updated to provide traffic signal control (via shifting the traffic signal control from Bluff Street to Sixth Street). This improvement will provide protected green time to traffic to and from Sixth Street instead of waiting for gaps in Liberty Avenue traffic, improving safety and mobility at the intersection. Shifting the traffic signal to the east will also help serve traffic to and from Beloit Memorial High School, providing better distribution of traffic
from the campus. While the Sixth Street traffic signal is approximately 570 feet from the existing traffic signal at Fourth Street, traffic signal phasing and timing can be coordinated to provide efficient traffic flow along Liberty Avenue with no queues spilling back to the upstream intersection.

## WIS 81 (Liberty Avenue), Fifth Street intersection

- It is recommended that the Fifth Street intersection be restricted (right-in, right-out access only) or removed at Liberty Avenue. This access management will aid in safety and mobility along Liberty Avenue by removing a full-access intersection between two closely-spaced traffic signals as well as reduce cut-through traffic to and from Beloit Memorial High School. This improvement also provides an opportunity to enhance the existing multi-use path crossing at Liberty Avenue, improving safety and comfort for bicyclists and pedestrians that use it.

## WIS 81 (Liberty Avenue), Fourth Street intersection

- It is recommended that, in the short-term, to maintain the existing intersection geometrics and intersection control (i.e., no-build condition). The existing intersection is anticipated to operate adequately (LOS D or better) during Year 2047 peak-hour conditions and the traffic signal will continue to provide dedicated green time for bikes/peds traveling to and from the high school.
- It is recommended that, as a long-term strategy, the intersection of Liberty Avenue and Fourth Street be realigned so the south and west legs (WIS 81) serve as the "through" movement. While this alternative has the largest impacts to the surrounding areas and is the most complex to implement, this alternative provides the greatest benefit to the intersection as it increases mobility along WIS 81 by making two adjacent intersection legs the "through" movement, allowing green time to be more efficiently allocated. Trucks and other large vehicles traveling along WIS 81 will become through movements in the area and not have to perform tight turns at this intersection. The traffic signal will remain in-place, which will provide bike/ped traffic dedicated signal time to cross WIS 81 unopposed.
- If the horizontal curve alternative is determined to be not feasible for implementation, the roundabout alternative should be considered. While impacts to surrounding parcels are likely, they are not as significant as the horizontal curve alternative. The roundabout is anticipated to provide adequate traffic operations while eliminating angle and head-on crashes due to the roundabout design. Splitter islands on all four quadrants will also allow bikes/peds to perform a two-stage crossing of a roadway.

## WIS 81 (Fourth Street), Liberty Avenue to Portland Avenue

- It is recommended that the Fourth Street cross-section be updated to provide a three-lane cross-section (two travel lanes and a TWLTL) with a parking lane. This alternative improves both safety and mobility as the TWLTL will allow left-turning vehicles to store and complete their turning movement to and from Fourth Street. In addition, the existing "trapping left" condition for northbound traffic at Liberty Avenue is eliminated with this
improvement. The on-street parking lane will provide additional parking supply in the area, particularly as the Brassworx site develops. These improvements can be accommodated within the existing roadway cross-section and right of way, minimizing construction costs and right of way acquisition.

## WIS 81 (Portland Avenue), US 51 intersection

- It is recommended that the intersection of Portland Avenue with US 51 be updated to reduce the number of eastbound through lanes from two to one. This improvement will eliminate the downstream "trapping right" condition at Woodward Avenue as well as the upstream lane utilization and "queue-jumping" issues on eastbound WIS 81, significantly improving safety in this area. Eliminating the second through lane will also allow the westbound left-turn lane to be shifted southerly so the left-turns at the intersection will create a positive left-turn offset, further improving safety at this location. It is anticipated that delays will increase with the reduction of roadway capacity for eastbound through movements, but LOS D or better operations are projected for all movements at this intersection. This alternative can be accommodated within the existing roadway crosssection and right of way, minimizing complexity to implement and associated costs.

## WIS 81 (White Avenue), Woodward Avenue intersection

- It is recommended that the White Avenue and Woodward Avenue intersection be restricted to right-turn in, right-turn out access only. This alternative eliminates lowervolume, left-turn movements at this intersection while maintaining the higher-volume, eastbound right-turn onto Woodward Avenue. Eliminating left-turn movements improves safety and mobility in the area by eliminating conflict points for WIS 81 motorists. This alternative can be implemented within the existing roadway cross-section.

## WIS 81 (White Avenue), Park Avenue intersection

- It is recommended that the White Avenue and Park Avenue intersection be updated from traffic signal control to roundabout control. This improvement will benefit safety by eliminating left-turn, angle, and head-on crashes due to the roundabout design and benefit mobility by providing yield control for motorists. The roundabout will reduce travel speeds at the intersection by forcing motorists to navigate around the roundabout median. The splitter islands will provide two-stage crossing for bicyclists and pedestrians. This improvement can be accommodated within the existing right of way.

## WIS 81 (White Avenue), Park Avenue to Milwaukee Road

- It is recommended that, in the short-term, to maintain the existing roadway cross-section (i.e., no-build condition). Most study intersections along this corridor are anticipated to operate at LOS D or better during Year 2047 conditions. In addition, discussions throughout the project with local stakeholders and residents raised concerns over the cost to widen the roadway cross-section, the potential loss of vegetation in the roadway terrace, and likely right of way acquisition to implement several alternatives favored maintaining the existing cross-section and right of way for as long as possible.
- To aid in maximizing the existing cross-section, it is recommended that access management strategies are considered for implementation along the White Avenue corridor. Strategies such as consolidation, cross-access, restriction, or removal of access to White Avenue will improve safety and mobility by reducing the number of access drives and conflict points which motorists must consider when driving along the roadway. Restriction or removal of public roadway access to White Avenue should be investigated further to determine candidate locations. If locations are determined, crossing elements at these restricted intersections should be implemented to improve bike/ped safety when crossing White Avenue.
- To aid in promoting bicycle use in eastern Beloit, it is recommended that bicycle routes parallel to White Avenue be promoted to connect the existing bike lanes and downtown Beloit with the eastern neighborhoods and commercial areas. Routes such as Keeler Avenue to the north and Woodward Avenue / Strong Avenue to the south provide long-distance parallel routes to White Avenue with significantly lower traffic volumes. In addition, bicycle-use elements, such as pavement markings or wayfinding signs can be installed along these parallel routes to promote their use by providing bicycle-centric features that add to the comfort level of using these routes.
- It is recommended that, as a long-term solution, the White Avenue cross-section be updated to provide a three-lane cross-section (two travel lanes and a TWLTL). This alternative improves both safety and mobility as the TWLTL will allow left-turning vehicles to store and complete their turning movement to and from White Avenue. Widening of the roadway cross-section will be necessary to implement this alternative so this improvement should be considered as part of a larger roadway reconstruction project that requires adjusting utilities beneath the roadway.

## WIS 81 (White Avenue), Milwaukee Road intersection

- Both alternatives, updating the intersection to a roundabout or installing numerous intersection improvements, improve safety by reducing travel speeds approaching and through the intersection. Both alternatives, also, address bicycle and pedestrian accommodations to cross White Avenue by providing two-stage crossing at the intersection. Both alternatives will provide adequate mobility for both White Avenue and Milwaukee Road traffic. Therefore, both alternatives would be beneficial to addressing the needs of the intersection. It is recommended, though, that the numerous intersection improvements be implemented at this location as these improvements can be constructed within the roadway cross-section and right of way. The roundabout alternative will likely require right of way to construct the circulation lanes and sidewalks around the intersection.

## Other recommendations

In addition to the recommendations previously discussed, there are other locations in the study area that would benefit from improvements, but the improvement is more systemic (e.g., reviewing traffic signal phasing / timing) or the improvement does not have a comparable alternative to evaluate against it. Therefore, the following describes other recommendations to improve safety, mobility, access, and multimodal accommodations along the WIS 81 corridor:

- It is recommended that crosswalk pavement markings be monitored and refreshed to maintain their visibility for motorists and bicyclists/pedestrians. In particular, the crosswalks at the Liberty Avenue and Fourth Street intersection should be updated due to its location near Beloit Memorial High School.
- It is recommended that crosswalks at unsignalized intersections east of US 51 be installed to provide a defined path for bicyclists/pedestrians crossing the side-street or WIS 81.
- It is recommended that the Liberty Avenue and Fifth Street intersection be enhanced with signing and marking to promote safer, more comfortable crossing for bicyclists and pedestrians using the multi-use path at this location.
- It is recommended that access management strategies near the Fourth Street and Portland Avenue intersection be employed as the proposed Brassworx site becomes developed. This improvement will allow for safe and efficient operations at the signalized intersection without impacting driveways or roadways nearby.
- It is recommended that traffic signal equipment is reviewed for improved visibility and clarity for motorists. Examples of this include inspecting and adding backplates (or retroreflective backplates) to each signal head, checking the placement of overhead signal heads over each through or turn lane, and examining the placement of each signal head to ensure that motorists can clearly see them without obstruction.
- It is recommended to provide signing and marking along Portland Avenue to connect the existing bike lanes to the Fifth Street multi-use path. Currently, the on-street bike lanes abruptly end at Fourth Street, one block east of the multi-use path, with no additional information about the path. Adding signing and marking along this one-block stretch of Portland Avenue will provide a vital connection for bicyclists traveling through the City of Beloit.
- It is recommended that intersection sight triangles be reviewed at unsignalized intersections along WIS 81 and address any locations with obstructions. Maintaining clear and unobstructed sight triangles improves safety for both WIS 81 and side-street traffic by providing sight lines for vehicles to see each other as they approach an intersection. Items such as vegetation, fences, lawn decorations, and utility poles can block the field of vision for a driver and increase crash risk due to approaching vehicles "hiding" behind objects. In the event obstructions are present within a sight triangle, they should be removed or minimized (e.g., vegetation trimmed) as much as possible.
- The intersection of White Avenue with Wisconsin Avenue is an example of a location where obstructions along White Avenue impede the field of vision for motorists along Wisconsin Avenue

### 1.0 Introduction

Wisconsin Highway 81 (WIS 81) is a significant east-west, principal arterial in the City of Beloit as it connects commuters and freight from western Rock County and residential neighborhoods in western Beloit with downtown Beloit, eastern Beloit, and the I-39/90 and I-43 freeway corridors. Within the study area, WIS 81 travels through several distinct environments and its roadway features reflect these surroundings. From WIS 213 (Madison Road) to Fourth Street, WIS 81 is a two-lane undivided roadway that is the primary east-west route for several residential neighborhoods and the Beloit Memorial High School campus. From Fourth Street to Park Avenue, WIS 81 is primarily a four-lane roadway that connects numerous commercial and industrial properties, as well as access to downtown Beloit, to the surrounding areas. This segment also provides an important crossing of the Rock River, one of five river crossings in the City of Beloit. From Park Avenue to Milwaukee Road, WIS 81 is a two-lane undivided roadway that runs through several residential neighborhoods. East of Milwaukee Road, WIS 81 transitions back to a four-lane divided roadway that serves commercial properties to the east.
The WIS 81 corridor provides multimodal accommodations such as sidewalks, crosswalks, bicycle lanes, and multi-use paths; however, these elements are disjointed and do not connect with each other, creating continuity issues for its users. In addition, WIS 81 provides limited opportunities for bicyclists and pedestrians to cross safely and comfortably - particularly through the residential neighborhoods on the eastern and western ends of the corridor.

### 1.1 Study Purpose

The purpose of this corridor study is to provide recommendations that the City of Beloit and Stateline Area Transportation Study (SLATS MPO), in coordination with the Wisconsin Department of Transportation (WisDOT) can incorporate into a roadway design project for construction. In addition, intersection recommendations can be developed into a Highway Safety Improvement Program (HSIP) funding application to address identified safety issues along the corridor. The goals of this study are listed below:

- Evaluate present-day conditions of the WIS 81 corridor study area to identify roadway needs, operational and safety concerns, multimodal accommodations, and opportunities for potential improvements
- Determine future planned and/or proposed developments along or near the WIS 81 corridor that will increase demand for use of the roadway
- Develop roadway and intersection strategies that will improve the viability of the corridor while balancing the traffic safety, traffic operations, access, and multimodal needs of its users

### 1.2 Study Area

The WIS 81 corridor study area runs from WIS 213 (Madison Road) easterly to Milwaukee Road. Key intersections within the study area include the following:

- WIS 81 and WIS 213 (Madison Road)
- WIS 81 and Hackett Street
- WIS 81 and Bluff Street
- WIS 81 and Sixth Street
- WIS 81 and Fourth Street
- WIS 81 and Portland Avenue
- WIS 81 and US 51 (Riverside Drive / Pleasant Street)
- WIS 81 and Woodward Avenue
- WIS 81 and Prince Hall Drive
- WIS 81 and Park Avenue
- WIS 81 and Wisconsin Avenue
- WIS 81 and Prairie Avenue
- WIS 81 and Milwaukee Road

The general study area limits are illustrated in Figure 1.1.

### 1.3 Study Approach

This study was completed utilizing industry accepted publications such as the Institute of Transportation Engineers (ITE) Trip Generation Manual, WisDOT's Facilities Development Manual (FDM), AASHTO's Policy of Geometric Design of Highways and Streets, and FHWA's Manual on Uniform Traffic Control Devices (MUTCD). These design standards aidd in determining substandard components within the existing roadway and helped develop alternatives to address the concerns.

Additionally, the City and SLATS MPO requested public input during the project to engage the public, local stakeholders, and policy makers help confirm problem locations, identify needs and desires for consideration, and provide feedback about potential alternatives within the study area. Three public information meetings (PIMs) were conducted throughout the project that allowed attendees to provide direct feedback on existing concerns and proposed alternatives that were developed for consideration.

Project Study Area
Wisconsin 81 Corridor Study
Beloit, Wisconsin

### 2.0 Existing Area Conditions

### 2.1 Roadway Transportation System

Descriptions of major area roadways within the study area are summarized below. Roadway and intersection characteristics are illustrated in Figure 2.1.

## Wisconsin Highway 81 (WIS 81)

WIS 81 is an east-west roadway that connects the western and eastern areas of Beloit via a crossing over the Rock River. From WIS 213 to Fourth Street, WIS 81 is also known as Liberty Avenue and provides a two-lane undivided urban cross-section. At Fourth Street, WIS 81 turns south and follows Fourth Street to Portland Avenue. At Portland Avenue, WIS 81 turns east and follows Portland Avenue to US 51. From Liberty Avenue to US 51, WIS 81 provides a four-lane undivided urban cross-section. From US 51 to Milwaukee Road, WIS 81 is also known as White Avenue and provides a two-lane cross-section. The entire section of WIS 81 in this study area is classified as a principal arterial in the SLATS MPO area. Sidewalks are present on both sides of WIS 81 throughout the study area and marked, on-street bicycle lanes are provided on Portland Avenue/White Avenue from Fourth Street to Harrison Avenue. On-street parking is only permitted on WIS 81 between 11th Street and Vine Street. The cross-section width (including curb and gutter) varies along WIS 81, as illustrated below:

- Liberty Avenue segment: 40-42 feet pavement width
- Fourth Street segment: 48 -foot pavement width
- Portland Avenue segment: 58 -foot pavement width
- White Avenue segment: 30 -foot pavement width

The posted speed limit along WIS 81 is 25 mph throughout the study area. Traffic signal control is provided at Hackett Street; Bluff Street; Fourth Street; Portland Avenue; US 51; Prince Hall Drive; Park Avenue; and Prairie Avenue. Exclusive turn lanes are provided along WIS 81 at many key intersections within the study area. Beloit Transit Routes 1 and 6 run along Fourth Street while Routes 3 and 5 run east of Milwaukee Road.

Annual daily traffic (ADT) volumes along WIS 81 were taken in the year 2019 and vary throughout the study area. WIS 81 has approximately 11,000 vehicles per day (vpd) along Liberty Avenue, then decreases to 9,700 vpd along Fourth Street. Over the Rock River, WIS 81 has an ADT of 17,300 vpd (highest in the study area, the City of Beloit, and SLATS MPA) and approximately 15,000 vpd west of Park Avenue. Along White Avenue on the eastern end of the study area, WIS 81 has an ADT of approximately $12,800 \mathrm{vpd}$.

## Wisconsin Highway 213 (WIS 213)

WIS 213 is primarily a two-lane, north-south principal arterial roadway that connects western Rock County and western Beloit to downtown Beloit. WIS 213 runs concurrent with WIS 81 from Madison Road to Portland Avenue. Exclusive turn lanes are provided along WIS 213 at many key intersections while concurrent with WIS 81. Beloit Transit Route 6 runs along WIS 213 south of WIS 81. Sidewalks are provided on the east side of WIS 213 north of Liberty Avenue and on both sides of WIS 213 through the study area. On-street parking is provided between 11th Street and Vine Street and the roadway has a posted speed limit of 25 mph .

## United States Highway 51 (US 51)

US 51, also known as Riverside Drive north of WIS 81 and Pleasant Street south of WIS 81, is a four-lane, north-south principal arterial roadway that is a vital north-south route within the Beloit metropolitan area. At its signalized intersection with WIS 81, exclusive turn lanes are provided on both approaches of US 51. The Beloit-Janesville Express transit route runs along US 51 with stops near WIS 81. Sidewalks are provided along both sides of US 51 north of WIS 81 and only on the west side south of WIS 81 . On-street parking is prohibited on US 51 and the roadway has a posted speed limit of 30 mph near WIS 81.

## Park Avenue, Prairie Avenue

Park Avenue and Prairie Avenue are arterial roadways that are primary north-south routes in eastern Beloit. Both roadways are primarily two-lane roadways except for Park Avenue north of WIS 81, which provides two travel lanes in each direction. However, the outside northbound lane accommodates occasional parking, which can limit the use of the outside lane for travel. At WIS 81, both roadways provide exclusive turn lanes (left and right-turn lanes on Park Avenue, leftturn lanes on Prairie Avenue) and both intersections are under traffic signal control. Beloit Transit Route 2 run along both roadways. Sidewalks are present on both sides of Park Avenue and Prairie Avenue. On-street parking is prohibited on both sides of Prairie Avenue and the west side of Park Avenue north of WIS 81 ; on-street parking is permitted on the east side of Park Avenue north of the Old Fashion Bakery entrance and on both sides south of WIS 81.

## Sixth Street, Hackett Street

Sixth Street (also known as County D) and Hackett Street are arterial roadways that are primary north-south routes in western Beloit. Both roadways are primarily two-lane roadways except for southbound Sixth Street approaching WIS 81, which provides two travel lanes in that direction At WIS 81, a northbound left-turn lane is provided on Hackett Street while the southbound approach is flared which serves as a de facto right-turn lane. Sixth Street provides an unmarked, de facto right-turn lane on its southbound approach with WIS 81. The Hackett Street intersection is under traffic signal control while all movements from Sixth Street are under stop-sign control. Sidewalks are present on both sides of Sixth Street and Hackett Street. Beloit Transit Route 1 runs along both Sixth Street and Hackett Street. On-street parking is permitted on both sides of Hackett Street and on both sides of Sixth Street south of WIS 81. On-street parking is permitted on the east side of Sixth Street north of WIS 81.

## Milwaukee Road

Milwaukee Road is a two-lane, north-south collector roadway that serves a residential neighborhood on the City's east side. At WIS 81, the designation of Milwaukee Road comprises the south and east approaches. At WIS 81, a westbound left-turn lane is provided from westbound Milwaukee Road to southbound Milwaukee Road and all movements from the south approach are under stop-sign control. On-street parking is prohibited on both sides of Milwaukee Road between Edan Court and White Avenue and Beloit Transit Routes 3 and 5 run along Milwaukee Road.

## Bluff Street, Woodward Avenue, Wisconsin Avenue, Prince Hall Drive

These roadways are collector roadways or local streets that serve residential neighborhoods or commercial properties. Prince Hall Drive and Bluff Street have traffic signal control at WIS 81; movements from Woodward Avenue and Wisconsin Avenue at WIS 81 are under stop-sign control. Exclusive left-turn and right-turn lanes are provided on Prince Hall Drive at WIS 81 while an exclusive right-turn lane is provided on northbound Bluff Street at WIS 81.

Existing Intersection Configurations

### 2.2 Area Land Uses

For much of the study area, WIS 81 travels through residential neighborhoods and land uses that support them. WIS 81, as Liberty Avenue, travels through residential areas in western Beloit and turns south (Fourth Street) at the Beloit Memorial High School campus. Several local retail parcels are scattered along Liberty Avenue. Along Fourth Street, retail, and commercial parcels line both sides of WIS 81. At Portland Avenue, the Ironworks campus and other ancillary commercial/industrial properties are located on the south side of the roadway, west of the Rock River. East of the Rock River, Riverside Park is located on the north side of the roadway while Beloit College is on the south side. Along White Avenue, the ABC Supply campus along with a mix of commercial and residential uses are north of the roadway while the Beloit College campus continues south of the roadway. East of Park Avenue, land uses transition back to residential neighborhoods to Milwaukee Road. It should be noted that two of Beloit's three fire stations are in the study area, with headquarters at Park Avenue and Station 3 at McKinley Avenue, one block west of the WIS 81 and WIS 213 (Madison Road) intersection.

### 2.3 Planned Roadway Improvement Projects

Several roadway improvement projects are planned for construction within the WIS 81 study area. While these projects will not be constructed for some time, it is important to note these projects in the existing conditions as they will address roadway and intersection issues that currently existing along WIS 81 . These projects are described below:

- WIS 81, WIS 213, and McKinley Avenue "triangle" intersection. WisDOT is currently investigating improvements at the WIS 81, WIS 213, and McKinley Avenue "triangle" intersection to address mobility and safety concerns. At the time of this study, a preferred alternative has not been finalized; however, improvements at this location are scheduled for Year 2027-2028 construction.
- WIS 81 curb ramp reconstruction. WisDOT is currently identifying existing sidewalk curb ramp installations along WIS 81 to improve to meet ADA and WisDOT design standards. These improvements are scheduled for Year 2027-2028 construction.
- WIS 81 bridge over Rock River. WisDOT has identified this bridge for joint and parapet repairs to maximize the life of the structure. These improvements are scheduled for Year 2027-2028 construction.
- WIS 81 and Milwaukee Road intersection. WisDOT and the City of Beloit is currently investigating improvements at the WIS 81 and Milwaukee Road intersection to address mobility and safety concerns. At the time of this study, a preferred alternative has not been identified. This improvement is tentatively planned for construction in Year 2028.

### 2.4 Data Collection Plan

Data collection efforts focused on gathering and organizing a variety of information related to the study area. A field review of the study area was performed to gather intersection and roadway geometrics, multimodal facilities, and surrounding land uses. Traffic signal phasing and timing information within the study area was provided by the City of Beloit. Intersection turning movement counts were gathered to understand traffic operations during peak traffic periods within the study area.

Key intersections evaluated in this study were identified during the project scoping process. It was determined that intersection data collection would be conducted at the following locations:

- WIS 81 and Hackett Street
- WIS 81 and Bluff Street
- WIS 81 and Sixth Street
- WIS 81 and Fourth Street
- WIS 81 and Portland Avenue
- WIS 81 and US 51 (Riverside Drive / Pleasant Street)
- WIS 81 and Woodward Avenue
- WIS 81 and Prince Hall Drive
- WIS 81 and Park Avenue
- WIS 81 and Wisconsin Avenue
- WIS 81 and Prairie Avenue
- WIS 81 and Milwaukee Road

Key roadway and intersection locations are shown in Figure 2.1.

### 2.5 Peak Hour Turning Movement Counts

Weekday morning (7:00 to 9:00 a.m.) and weekday afternoon (2:00 to 6:00 p.m.) peak hour turning movement counts were collected at many the above-mentioned intersections over several days in May 2022. The counts, collected by IMEG Corporation, used video-based data collection technology. It was determined that the morning peak hour of the study area occurred from 7:15 a.m. to $8: 15 \mathrm{a} . \mathrm{m}$. and the afternoon peak hour occurred from $3: 15 \mathrm{p} . \mathrm{m}$. to $4: 15 \mathrm{p} . \mathrm{m}$.

Intersection turning movement counts at the WIS 81 intersections with Wisconsin Avenue, Prairie Avenue, and Milwaukee Road were collected in October 2022. The weekday morning and afternoon peak hours determined from the May 2022 counts were applied to this data for consistency purposes.
Balanced peak hour turning movement volumes are illustrated in Figure 2.2 while intersection turning movement count summaries for each intersection are provided in Appendix A.

Existing-Year Peak-Hour Intersection Volumes

### 3.0 Corridor Safety Analysis

The existing roadway and intersection geometrics were reviewed to determine whether design standards and multimodal accommodations are met. Roadway and intersection crash data on WIS 81 from Year 2017 through May 2022 were obtained from WisDOT for review. This review investigated for crash commonalities and trends through the project corridor. The following section summarize the processes and results for the safety analysis.

### 3.1 Geometric Review

Roadway and intersection geometry along the corridor was reviewed and compared to national (AASHTO) and state (WisDOT Facilities Development Manual) standards. These standards provide information on recommended cross section elements, horizontal and vertical profile, site distance and intersection spacing. The following locations raise potential concerns to be considered for future improvements.

## WIS 81 Corridor

The WIS 81 and WIS 213 (Madison Road) intersection is a skewed unsignalized intersection that can restrict visibility of motorists along WIS 213 to see approaching vehicles along WIS 81. As previously mentioned, this intersection is currently being studied for intersection improvement.

The residential areas along the eastern and western parts of the WIS 81 study area provide numerous access points to the roadway, such as public streets, public alleys, and private driveways. An access review of the study area found that Liberty Avenue, from Madison Road to Fourth Street ( 0.90 miles) has 85 access points while White Avenue, from Harrison Avenue to Milwaukee Road ( 0.62 miles) has 62 access points. Roadways with high access density (the number of access points over given distance -94 access points per mile along Liberty Avenue, 100 access points per mile along White Avenue), can increase crash risk as vehicles can enter and exit the WIS 81 traffic stream at numerous locations over a short distance of roadway.

## WIS 81 at Garfield Avenue, Moore Street, and Tenth Street intersections

These unsignalized intersections have side-streets that are slightly offset and not lined up opposite of each other. These skews increase crash risk as left-turns from WIS 81 or from the side-streets may interfere with each other as their turning paths cross each other, potentially leading to sideswipe crashes. Furthermore, through movements from the side-streets must laterally shift while traveling through the intersection, increasing driver expectancy issues at these locations.

## WIS 81 near Bluff Street intersection

The signalized intersection of WIS 81 and Bluff Street is located at the top of a vertical curve along WIS 81. East of the intersection, the elevation of WIS 81 lowers as the roadway nears the Rock River. This alignment may become difficult for westbound vehicles when WIS 81 traffic is stopped at Bluff Street for vehicles must stop, queue, and accelerate on the vertical curve. This condition may be especially difficult for large trucks that do not have the acceleration characteristics of passenger vehicles.

## WIS 81 at Fifth Street intersection

The unsignalized intersection of WIS 81 and Fifth Street has a multi-use path separating the through lanes on both approaches of Fifth Street. The multi-use path crosses WIS 81 and a marked crosswalk is provided to delineate this crossing. Bicycle crossing warning signs (MUTCD W11-1) are provided on WIS 81 approaching this path, but no other features are provided that alert motorists of the exact location of the crossing as well as provide comfort to bicyclists and pedestrians as they cross WIS 81 (see image below). In addition, stop signs are not provided on the path to alert these users that they are crossing a principal arterial roadway.

Looking east at Fifth Street

## WIS 81 at Fourth Street intersection

The signalized intersection of WIS 81 and Fourth Street experiences an increased amount of truck traffic using the south and west intersection legs to follow the WIS 81 roadway designation. The compact physical intersection footprint at this location may require trucks to encroach into oncoming traffic to complete their turning movement. While the stop bar for the west approach leg is located further away to accommodate truck turning paths, longer or wider trucks may still have to travel on opposing lanes to complete their turn.

The northbound (south) leg approaching this intersection provides two through lanes for travel. However, the inside through lane immediately becomes an exclusive left-turn lane at Liberty Avenue. This "trapping left" lane condition can cause motorists wishing to continue traveling northbound on Fourth Street to quickly and abruptly change lanes to avoid the left-turn lane, increasing crash risk along WIS 81 approaching and at the intersection.

Source: Google Earth

## WIS 81 and US 51 \& Woodward Avenue intersections

The unsignalized Woodward Avenue intersection is located approximately 250 feet east of the signalized US 51 intersection. Eastbound WIS 81 traffic are provided two through lanes through US 51. However, the outside through lane immediately becomes an exclusive right-turn lane for Woodward Avenue. This "trapping right" lane condition can cause motorists wishing to continue traveling eastbound on WIS 81 to quickly and abruptly change lanes to avoid the right-turn lane, increase crash probability along WIS 81 between the intersections. In addition, motorists familiar with the "trapping right" may use the outside through lane at US 51 to pass slower-moving vehicles in the inside lane. This affects both safety, due to an increase in sideswipe and rear-end crashes, as well as mobility as traffic behind the merging vehicle(s) may have to slow or stop to avoid collisions.

Source: Google Earth

Looking east on WIS 81 at US 51

## WIS 81 with Portland Avenue, US 51, Park Avenue, and Prairie Avenue

These signalized intersections have left-turn lanes along WIS 81or the side-streets that have a negative left-turn lane offset. "Left-turn lane offset" is the lateral distance between the left edge of a left-turn lane and the right edge of the opposing left-turn lane. This distance can be negative, zero, or positive (refer to proceeding image). Negative left-turn lane offset can increase crash risk for left-turning and through motorists when opposing traffic are in both left-turn lanes. When this occurs, motorists turning left may not see approaching vehicles in the opposite through lane due to the blocking left-turning vehicle and misjudge the available gap to complete their movement.

Source: Minnesota DOT
While a zero left-turn lane offset improves field of vision for left-turning motorists, their sight can still be obscured by opposing left-turn vehicles. Therefore, it is preferred that opposing left-turn lanes attempt to provide a positive offset at intersections.

## WIS 81 and Nelson Avenue intersection

This unsignalized intersection is located approximately 100 feet from the eastbound stop bar at the signalized Prairie Avenue intersection and within the approach taper for the eastbound leftturn lane. Having two closely spaced intersections can increase crash risk as many turning movements can occur over a short distance. Having an intersection within the functional area of an intersection, particularly within the left-turn lane, can increase rear-end crash potential as leftturning vehicles cannot make the distinction between turning left onto Nelson Avenue or Prairie Avenue. This can lead to misjudgment from following drivers and lead to rear-end crashes.

## WIS 81 at Prairie Avenue, Central Avenue, Partridge Avenue, Eaton Avenue, and Hinsdale Avenue intersections

The side-streets at these locations intersect WIS 81 at skewed angles and not at traditional 90degree, right angles. These skews, approximately 30 to 35 degrees, can increase crash risk on the side-streets as motorists entering or crossing WIS 81 likely have to adjust their body to see traffic approaching along WIS 81 . This need for adjustment can reduce their field of vision due to physical body limitations, parts of the car blocking their view, or inability to see clearly, which can result in misjudging gaps in the WIS 81 traffic stream.

## WIS 81 at Eaton Avenue and Hinsdale Avenue intersections

These unsignalized intersections have side-streets that are offset and not lined up opposite of each other. These offset approach legs increase crash risk as left-turns from WIS 81 or from the sidestreets may interfere with each other as their turning paths cross each other, potentially leading to sideswipe crashes. Furthermore, through movements from the side-streets must laterally shift while traveling through the intersection, increasing driver expectancy issues at these locations.

## WIS 81 and Milwaukee Road intersection

Similar to the US 51 and Woodward Avenue intersections, westbound WIS 81 at the White Avenue / Milwaukee Road intersection has a "trapping left" condition where the inside through lane becomes an exclusive left-turn lane for South Milwaukee Road. This condition increases crash probability as motorists may quickly and abruptly merge to the outside lane to avoid being "trapped" in the exclusive left-turn lane.

The speed limit for westbound WIS 81 reduces from 40 mph to 25 mph as the roadway approaches the White Avenue / Milwaukee Road intersection. At the 25 mph speed limit sign, approximately 1,200 feet east of the intersection, WIS 81 provides multiple through lanes, a wide clear zone outside the through lanes, and few access drives for motorists to negotiate. In other words, the roadway environment is not conducive for motorists to follow the 25 mph travel speed; rather, motorists typically travel at faster speeds as they don't feel restricted to slow down. At the intersection, the westbound lanes veer to the right and unfamiliar motorists may not be ready for the "trapping left" lane condition and the sharper horizontal curve. This can increase the probability of motorists leaving the roadway or crossing into oncoming traffic as they do not negotiate the curve at the posted speed.

Source: Google Earth

### 3.2 Multimodal Accommodations Review

A field review of existing infrastructure for bicyclists and pedestrians, such as sidewalks, bike lanes, and bike paths, was performed to understand their current state. This evaluation included the physical state of the surface, associated pavement markings or other infrastructure, wayfinding or guidance elements, and connectivity.

## Pedestrian Accommodations

Sidewalks are provided along both sides of WIS 81 throughout the entirety of the study area. While the sidewalks through the residential areas of Liberty Avenue and White Avenue are older and narrower, a connected, navigable walking path is provided for pedestrians to use. Curb ramps at the majority of intersections appear to be either outdated and not compliant with ADA standards. It should be noted, though, that a future WisDOT project will update these noncompliant curb ramps. Crosswalks are provided at all signalized intersections, but consideration should be given to refresh them to increase their visibility to motorists. In particular, the crosswalks at the Fourth Street intersection should be updated due to its activity from Beloit Memorial High School. Marked crosswalks are provided at unsignalized intersections west of US 51 but not at locations east of US 51 even though curb ramps are present to cross WIS 81; for consistency purposes, consideration should be given to install marked crosswalks along and crossing WIS 81 to give bicyclists and pedestrians a defined path to cross the roadway.

A multi-use path runs from ABC Supply Stadium to Beloit Memorial High School in western Beloit, parallel to Fifth Street. At WIS 81, marked crosswalks and advanced warning signs are provided to alert motorists of the path. However, because the path runs between the travel lanes of Fifth Street, similar to a boulevard, the presence of the path can become lost with motorists likely looking for traffic entering and exiting Fifth Street.
The White Avenue portion of WIS 81, particularly from Park Avenue to Milwaukee Road, can function as an impediment for pedestrians wishing to cross the roadway. Several factors help foster this condition:

- The amount of daily traffic (approximately $12,800 \mathrm{vpd}$ ) along a two-lane roadway crosssection creates few natural gaps for pedestrians to feel comfortable crossing
- The lack of marked crosswalks along this section (except for Prairie Avenue)
- The lack of intersections that interrupt WIS 81 traffic to allow pedestrians to cross (only Prairie Avenue is signalized in this stretch of WIS 81)
- The horizontal curve at Milwaukee Road can hide pedestrians from westbound traffic
- The amount of access density (roadways and driveways) along this stretch of WIS 81 can shift a motorist's focus away from looking for pedestrians and more to other vehicles

## Bicycle Accommodations

An on-street marked bicycle lane is provided along Portland Avenue and White Avenue from Fourth Street to Harrison Avenue. The pavement surface of the bike lane appears to be satisfactory for travel; however, the pavement joint between the travel lane and bike lane was patched in numerous places which can lead to an uneven surface as a bicyclist gets closer to the left side of the bike lane. Pavement markings and symbols are provided to inform motorists of the bike lane, but there are no follow-through skip markings at intersections to show the bike path between a through lane and a right-turn lane (westbound at Portland Avenue, eastbound at US 51, eastbound and westbound at Park Avenue, for example - see image below).

Looking west at Portland Avenue
The existing bicycle lane, while useful for bicyclists to use, does not aid in the east-west connectivity of dedicated bicycle facilities in the City of Beloit. For example, there are no bicycle facilities provided that connects this east-west bicycle lane to the multi-use path along Fifth Street. To the east, there are no facilities that connects the lane to the retail and commercial areas in eastern Beloit. This lack of physical connectivity, and subsequent lack of wayfinding or direction guidance, can dissuade bicyclists from traveling longer distances throughout the city.

### 3.3 Intersection Crash Statistics

WisDOT provided crash data (Years 2017 through May 2022) for the extents of the WIS 81 corridor. This data was reviewed for crash frequency, severity, and commonalities for key intersections and roadway segments throughout the study area. Table $\mathbf{3 . 1}$ illustrates the injury type, total crashes, and intersection crash rate for each location.

As a general rule of thumb, locations with an intersection crash rate above 1.0 crashes per million entering vehicles (MEV) should be considered for further investigation and mitigation. From the table, three intersections: Sixth Street, US 51, and Wisconsin Avenue, have crash rates above the 1.0 threshold while the Hackett Street intersection is just below the threshold (0.98).

The following outlines historical crash data at the key study intersections and any crash trends or commonalities identified from the crash review.

Table 3.1 Intersection Crash Statistics

| Intersection | Injury Type |  |  |  |  | Total <br> Crashes | Crash Rate <br> (MEV) |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | K | A | B | C | O |  | 0.98 |
|  | 0 | 0 | 2 | 4 | 22 | 28 | 0.62 |
|  | 0 | 1 | 3 | 2 | 12 | 18 | 1.14 |
|  | 0 | 1 | 2 | 3 | 35 | 41 | 0.57 |
|  | 0 | 0 | 2 | 2 | 12 | 16 | 0.45 |
| Portland Avenue | 0 | 0 | 0 | 3 | 16 | 19 | 0.21 |
| US 51 | 0 | 1 | 4 | 13 | 49 | 67 | 1.27 |
| Woodward Avenue | 0 | 1 | 0 | 0 | 12 | 13 | 0.37 |
| Prince Hall Drive | 0 | 0 | 0 | 0 | 2 | 2 | 0.06 |
| Park Avenue | 0 | 1 | 0 | 2 | 21 | 24 | 0.66 |
| Wisconsin Avenue | 0 | 1 | 4 | 2 | 28 | 35 | 1.16 |
| Prairie Avenue | 0 | 1 | 0 | 3 | 26 | 30 | 0.81 |
| Milwaukee Road | 0 | 2 | 1 | 0 | 10 | 13 | 0.42 |

Crash data obtained from UW TOPS Lab for 2017 through May 2022
K - fatal crash ; A - serious injury crash ; B - minor injury crash ;
C - possible injury crash ; O - property damage only crash
Crash rate - crashes per million entering vehicles (MEV)

## WIS 81 and Hackett Street

At the intersection of WIS 81 and Hackett Street, 28 intersection-related crashes were reported in the past 5.5 years. Of those 28 crashes, 11 were rear-end crashes, 11 were angle crashes, 5 were single-vehicle crashes, and 1 was a head-on crash. 8 of 11 rear-end crashes involved vehicles traveling eastbound or westbound on WIS 81.7 of 11 angle crashes involved a vehicle traveling southbound on Hackett Street being struck by a vehicle traveling on WIS 81.
The majority of rear-end crashes may be the result of the absence of a left-turn lane along WIS 81. It is possible that left-turning vehicles are storing in the WIS 81 through lanes which may increase rear-end crashes as following vehicles are not anticipating the left-turning vehicles. The majority of angle crashes may be the result of Hackett Street motorists attempting to "beat" the red traffic signal phase and are struck by WIS 81 traffic.

## WIS 81 and Bluff Street

At the intersection of WIS 81 and Bluff Street, 18 intersection-related crashes were reported in the past 5.5 years. Of those 18 crashes, 8 were angle crashes, 6 were rear-end crashes, 2 were sideswipe crashes, and 2 were single-vehicle crashes. 4 of 6 rear-end crashes involved vehicles traveling eastbound on WIS 81.

## WIS 81 and Sixth Street

At the intersection of WIS 81 and Sixth Street, 41 intersection-related crashes were reported in the past 5.5 years. Of those 41 crashes, 22 were angle crashes, 8 were rear-end crashes, 7 were sideswipe crashes, 3 were single-vehicle crashes, and one was a head-on crash. 4 of 8 rear-end crashes involved vehicles traveling eastbound on WIS 81.6 of 8 rear-end crashes involved vehicles traveling southbound on Sixth Street. 14 of 22 angle crashes involved a southbound vehicle being struck by vehicles traveling on WIS 81.8 of 38 crashes involved a teenage driver.

It is likely that the majority of angle crashes are the result of motorists along Sixth Street becoming frustrated with the few gaps in the WIS 81 traffic stream and become more aggressive and accepting smaller gaps to enter the intersection. This condition can be typical of side-streets intersecting higher-volumes arterials under stop-sign control. This condition can be compounded by having inexperienced drivers, such as motorists from the high school, using the intersection.

## WIS 81 and Fourth Street

At the intersection of WIS 81 and Fourth Street, 16 intersection-related crashes were reported in the past 5.5 years. Of those 16 crashes, 7 were rear-end crashes, 3 were angle crashes, 2 were sideswipe crashes, 2 were single-vehicle crashes, and 2 were head-on crashes. 4 of 7 rear-end crashes involved vehicles traveling eastbound on WIS 81.5 of 16 crashes involved a teenage driver. Similar to Sixth Street, the location of the high school campus increases the amount of young, inexperienced drivers to the intersection which results in an increased crash risk due to their typical inability to assess gaps and approaching speeds.

## WIS 81 and Portland Avenue

At the intersection of WIS 81 and Portland Avenue, 19 intersection-related crashes were reported in the past 5.5 years. Of those 19 crashes, 6 were rear-end crashes, 6 were angle crashes, 5 were sideswipe crashes, and 2 were head-on crashes. 9 of 19 crashes involved a vehicle traveling eastbound being struck.

## WIS 81 and US 51

At the intersection of WIS 81 and US 51, 67 intersection-related crashes were reported in the past 5.5 years; this was the most intersection-related crashes in the study area. Of those 67 crashes, 25 were rear-end crashes, 19 were angle crashes, 11 were single-vehicle crashes, 9 were sideswipe crashes, and 2 were head-on crashes. 19 of 67 crashes resulted in injuries, including 1 A-injury (severe injury). 10 of 25 rear-end crashes involved westbound vehicles while 8 of 25 involved eastbound vehicles. 14 of 19 angle crashes involved a vehicle traveling westbound and 10 of 19 angle crashes involved a vehicle traveling eastbound; this included 5 crashes that involved an eastbound left-turning vehicle being struck by a westbound-traveling vehicle.
It is likely that the geometrics at this intersection aid in the high number of crashes at this intersection. The intersection is located at the bottom of a hill for westbound traffic; it is likely that motorists are following too closely and at higher speeds down the hill and do not properly react to the vehicle in front of them. The eastbound approach also has a trapping right condition downstream which creates poor lane utilization and motorists making sudden merges or "queue jumps" from the outside lane to avoid being stuck in the downstream right-turn lane. As previously mentioned, all left-turn lanes have a negative or zero left-turn lane offset which can
block the vision of left-turning motorists of approaching vehicles in the opposite lanes. This condition can increase crash risk for left-turning traffic as they are unaware of approaching vehicles as they complete their turn movement.

## WIS 81 and Woodward Avenue

At the intersection of WIS 81 and Woodward Avenue, 13 intersection-related crashes were reported in the past 5.5 years. Of those 16 crashes, 8 were sideswipe crashes, 3 were rear-end crashes, 1 was an angle crash, and 1 was a single-vehicle crash. All 13 crashes involved a vehicle traveling eastbound. These crashes are likely the result of the existing trapping right condition along eastbound WIS 81 and motorists making quick merges to avoid being stuck in this lane.

## WIS 81 and Prince Hall Drive

Two crashes were reported at the WIS 81 and Prince Hall Drive intersection. One crash was a rear-end crash and the other was a single-vehicle crash. Both crashes occurred to vehicles traveling westbound along WIS 81.

## WIS 81 and Park Avenue

At the intersection of WIS 81 and Park Avenue, 24 intersection-related crashes were reported in the past 5.5 years. Of those 24 crashes, 11 were rear-end crashes, 6 were angle crashes, 3 were single-vehicle crashes, 2 were sideswipe crashes, and 2 were head-on crashes. The 11 rear-end crashes did not have a predominant movement in which the crashes occurred. 4 of 6 angle crashes involved a northbound vehicle and a westbound vehicle. Both head-on crashes involved an eastbound and westbound vehicle.

## WIS 81 and Wisconsin Avenue

At the intersection of WIS 81 and Park Avenue, 35 intersection-related crashes were reported in the past 5.5 years. Of those 35 crashes, 24 were angle crashes, 6 were rear-end crashes, 6 were angle crashes, 3 were single-vehicle crashes, 2 were sideswipe crashes, and 2 were head-on crashes. 19 of the 24 angle crashes involved a through movement from Wisconsin Avenue being struck by a through movement along WIS 81 (10 from northbound, 9 from southbound). 4 of 6 rear-end crashes involved eastbound vehicles.

The majority of angle crashes at this intersection may be the result of motorists along Wisconsin Avenue becoming frustrated with the few gaps in the WIS 81 traffic stream and become more aggressive and accepting smaller gaps to enter the intersection. This condition can be typical of side-streets intersecting higher-volume arterials under stop-sign control. In addition, a review of this intersection noted several objects were obstructing the field of vision for motorists along Wisconsin Avenue. These items, such as vegetation and sign poles, and utility poles, can block or hide approaching vehicles at the intersection and increase crash risk for motorists.

## WIS 81 and Prairie Avenue

At the intersection of WIS 81 and Prairie Avenue, 30 intersection-related crashes were reported in the past 5.5 years. Of those 30 crashes, 20 were rear-end crashes, 6 were angle crashes, 2 were single-vehicle crashes, 1 was a sideswipe crash, and 1 was a head-on crash. 11 of 20 rear-end crashes involved westbound vehicles while 6 of 20 involved eastbound vehicles. 15 of 30 crashes occurred during the midday hours of 11:00 a.m. and 3:00 p.m.

The rear-end crashes may be the result of motorists following too closely along a high-volume, low-speed, single-lane roadway and not reacting to phase changes at the signal properly. This condition may be aided by vegetation possibly obscuring the traffic signal heads, which can reduce the reaction time of motorists by not providing ample information of the traffic signal phase change. In addition, the stop bars along WIS 81 are set back from the intersection curb due to the intersection skew; this, in turn, creates a longer distance for motorists to travel through the intersection. This condition may make motorists become more aggressive to clear the intersection, particularly during the yellow clearance interval, and may follow too closely to vehicles in front of them.

## WIS 81 and Milwaukee Road

At the intersection of WIS 81 and Milwaukee Road, 13 intersection-related crashes were reported in the past 5.5 years. Of those 13 crashes, 7 were single-vehicle crashes (including one A-injury crash), 4 were sideswipe crashes, 1 was a rear-end crash, and 1 was an angle crash. 6 of the 7 single-vehicle crashes were motorists traveling westbound on WIS 81 and all 6 crashes were identified as speed-related crashes. In addition, 4 of the 6 westbound single-vehicle crashes occurred between 1:00 a.m. and 5:00 a.m.
As previously discussed, the approach speeds and horizontal curve at this intersection create an environment where motorists are comfortable traveling above the speed limit along westbound WIS 81 approaching the curve. When they attempt to navigate the curve, they realize it is too sharp at their increased speed and either overcompensate and run off the road to the right or cross the centerline into oncoming traffic and/or run off the road to the left.

### 4.0 Pavement and Traffic Signal Inventory

An investigation of the existing roadway pavement and traffic signal equipment was performed along WIS 81. This analysis will provide a preliminary evaluation of the roadway pavement condition and traffic signal equipment to determine if any deficiencies are present.

### 4.1 Roadway Pavement Evaluation

WIS 81 has a concrete pavement roadway surface and concrete curb and gutter throughout the entirety of the study area.

A visual and vehicle ride inspection of the roadway surface indicates that the Liberty Avenue, Fourth Street, and White Avenue (east of Park Avenue) portions of the roadway have joint failures which causes faulting from one concrete surface to the next. This results in an uneven or "rough" ride for motorists. Joint sealing and pavement patching near the joint are present along various portions of the roadway, which can add to the rougher ride for motorists. The Portland Avenue and White Avenue (west of Park Avenue) sections shows significant longitudinal and transverse patching between the travel lanes and at the curb and gutter, suggesting pavement improvement should be considered to improve ride. Frequent patching is present along this section suggesting that pavement and sub-pavement condition is deteriorating and requires improvement in the near-term.

[^0]
### 4.2 Traffic Signal Inventory

Eight traffic signal installations currently exist along WIS 81: Hackett Street; Bluff Street; Fourth Street; Portland Avenue; US 51; Prince Hall Drive; Park Avenue; and Prairie Avenue. The following describes an inventory of the equipment at each traffic signal location.
Hackett Street: Traffic signals and poles at this location are in good condition; while the traffic signals are operating properly, some signal heads are missing the backplate (see image). Backplates help distinguish the signal head from its background (e.g., sunlight). Consideration should be made to add backplates where necessary as well as install retroreflective backplates to enhance the visibility and noticeability of the signals.

The intersection provides an eastbound right-turn lane to accommodate a high number of rightturning vehicles (a maximum of 155 vehicles during the afternoon peak hour), but no exclusive left-turn lanes are provided along WIS 81. While the observed traffic counts for left-turns are low (less than 30 vehicles per hour during peak traffic conditions), it is possible that a left-turning vehicle could impede through movements by waiting for a gap to complete their turning movement. This is likely in the weekday afternoon peak hour where the amount of westbound through vehicles ( 560 vehicles) may create few naturals gaps or creates long platoons after a phase change which could make eastbound through vehicles wait longer periods of time.

Crosswalks and pedestrian equipment are provided on all intersection approaches. Consideration should be given to provide pedestrian countdown timers to inform pedestrians how much time remains for the pedestrian phase before the traffic signal phasing changes.

Hackett Street at Liberty Avenue, looking north
Bluff Street: Traffic signals and poles at this location are in good condition; while the traffic signals are operating properly, all signal heads are missing the backplate. Backplates help distinguish the signal head from its background (e.g., sunlight). Consideration should be made to add backplates where necessary as well as install retroreflective backplates to enhance the visibility and noticeability of the signals. A westbound left-turn lane is provided at Bluff Street, but no left-turn traffic signal equipment is provided. With the infrequent number of left-turning vehicles using the westbound left-turn lane (approximately one vehicle per minute during peak traffic conditions), the need for a protected left-turn phase is likely not needed to accommodate this movement.

Crosswalks and pedestrian equipment are provided on all intersection approaches. Consideration should be given to provide pedestrian countdown timers to inform pedestrians how much time remains for the pedestrian phase before the traffic signal phasing changes.

Fourth Street: Traffic signals and poles at this location are in good condition; while the traffic signals are operating properly, all signal heads are missing the backplate (see image). Backplates help distinguish the signal head from its background (e.g., sunlight). Consideration should be made to add backplates where necessary as well as install retroreflective backplates to enhance the visibility and noticeability of the signals.

Fourth Street at Liberty Avenue, looking south
Crosswalks and pedestrian equipment are provided on all intersection approaches. However, the crosswalk pavement markings are in poor condition and may not be readily visible to motorists. With the location of Beloit Memorial High School nearby and the amount of pedestrian traffic that travels through this intersection (approximately 55 pedestrians observed in thirty minutes after school release), the pavement markings at this intersection should be updated and consideration should be given to provide pedestrian countdown timers to inform pedestrians how much time remains for this phase before the traffic signal phasing changes.

Portland Avenue: Traffic signals and poles at this location are in good condition; while the traffic signals are operating properly, some signal heads are missing the backplate. Backplates help distinguish the signal head from its background (e.g., sunlight). Consideration should be made to add backplates where necessary as well as install retroreflective backplates to enhance the visibility and noticeability of the signals.

The north and south approaches of the intersection provide overhead signal heads for traffic; however, only one signal head is provided to control the left-turn lane and the two through lanes. It is recommended that a minimum of two signal heads (one for the left-turn and inside through lane and another for the outside through lane) be provided to control traffic at these approaches.

Fourth Street at Portland Avenue, looking south (Source: Google Earth)
Crosswalks and pedestrian equipment are provided on all intersection approaches. Consideration should be given to provide pedestrian countdown timers to inform pedestrians how much time remains for the pedestrian phase before the traffic signal phasing changes.

US 51: Traffic signals and poles at this location are in good condition; while the traffic signals are operating properly, several signal heads are missing the backplate. Backplates help distinguish the signal head from its background (e.g., sunlight). Consideration should be made to add backplates where necessary as well as install retroreflective backplates to enhance the visibility and noticeability of the signals.
All four approaches of the intersection provide overhead signal heads for traffic; however, only one signal head is provided to control the left-turn lane and the two through lanes. It is recommended that a minimum of two signal heads (one for the left-turn and inside through lane and another for the outside through lane) be provided to control traffic at these approaches.
The far overhead signal arm for eastbound traffic has a single overhead signal head and an exclusive right-turn lane sign with a plaque "RIGHT LANE" underneath it (MUTCD Signs R3-5 and R3-5fP, respectively). This sign placement is to inform motorists that the outside through lane, past the US 51 intersection, becomes an exclusive right-turn lane at Woodward Avenue. This introduces a "trapping right" lane situation for these motorists. While trapping-lane
conditions are not conducive to traffic operations, the information for this situation provided at a traffic signal could be seen as contradicting the pavement marking that provides a through lane and "ONLY" for the through lane. If the trapping lane condition cannot be mitigated, additional signage should be installed for this approach that provides a clearer understanding of the lane configurations downstream.

Crosswalks and pedestrian equipment are provided on all intersection approaches. Consideration should be given to provide pedestrian countdown timers to inform pedestrians how much time remains for the pedestrian phase before the traffic signal phasing changes.

Prince Hall Drive: Traffic signals and poles at this location are in good condition. Crosswalks and pedestrian equipment are provided on all intersection approaches.

Park Avenue: Traffic signals and poles at this location are in good condition; while the traffic signals are operating properly, several signal heads are missing the backplate. Backplates help distinguish the signal head from its background (e.g., sunlight). Consideration should be made to add backplates where necessary as well as install retroreflective backplates to enhance the visibility and noticeability of the signals.

Crosswalks and pedestrian equipment are provided on all intersection approaches. Consideration should be given to provide pedestrian countdown timers to inform pedestrians how much time remains for the pedestrian phase before the traffic signal phasing changes.

Prairie Avenue: Traffic signals and poles at this location are in good condition. Consideration should be made to install retroreflective backplates to enhance the visibility and noticeability of the signals. In addition, periodic visual checks of the signal heads should be performed to ensure that nearby trees do not block or impede traffic from seeing the signal heads (see image below).

Crosswalks and pedestrian equipment are provided on all intersection approaches. Consideration should be given to provide pedestrian countdown timers to inform pedestrians how much time remains for the pedestrian phase before the traffic signal phasing changes.

White Avenue at Prairie Avenue, looking west (Source: Google Earth)

### 5.0 Traffic Operations Analysis

To determine how traffic operates under existing conditions, an operational analysis was conducted for intersections identified in Section 2.4 using methodologies published in the Highway Capacity Manual (HCM). The HCM module in the traffic operations software package, Synchro11, was used to document the results of the traffic operations analysis. Operational analysis results identify a Level of Service (LOS), which is intended to depict the quality of traffic flow through an intersection. Signalized and unsignalized intersections are given a ranking from LOS A through LOS F as a function of the average control delay as presented in Table 5.1 for signalized intersections and Table 5.2 for unsignalized and roundabout intersections. For urban principal arterials such as WIS 81 , the minimum acceptable LOS is LOS D.

Table 5.1 Level of Service (LOS) Criteria, Signalized Intersections

| LOS <br> Designation | Average Control <br> Delay/Vehicle <br> (seconds) | Description |
| :--- | :--- | :--- |
| A | $\leq 10.0$ | Very low vehicle delays, free flow, signal progression extremely favorable, most <br> vehicles arrive during given signal phase. |
| B | 10.1 to 20.0 | Good signal progression, more vehicles stop and experience higher delays than <br> for LOS A. |
| C | 20.1 to 35.0 | Stable flow, fair signal progression, significant number of vehicles stop at <br> signals. |
| D | 35.1 to 55.0 | Congestion noticeable, longer delays and unfavorable signal progression, many <br> vehicles stop at signals. |
| E | 55.1 to 80.0 | Limit of acceptable delay, unstable flow, poor signal progression, traffic near <br> roadway capacity, frequent cycle failures. |
| F | $>80.0$ | Unacceptable delays, extremely unstable flow and congestion, traffic exceeds <br> roadway capacity, stop-and-go conditions |

Table 5.2: Level of Service (LOS) Criteria, Unsignalized Intersections

| LOS <br> Designation | Average Control <br> Delay/Vehicle <br> (seconds) | Description |
| :--- | :--- | :--- |
| A | $\leq 10.0$ | No delays at intersections with continuous flow of traffic. Uncongested <br> operations: high frequency of long gaps available for all left and right turning <br> traffic. No observable queues. |
| B | 10.1 to 15.0 | Same as LOS A |
| C | 15.1 to 25.0 | Moderate delays at intersections with satisfactory to good traffic flow. Light <br> congestion; infrequent backups on critical approaches. |
| D | 25.1 to 35.0 | Increased probability of delays along every approach. Significant congestion on <br> critical approaches, but intersection functional. No standing long lines formed. |
| E | 35.1 to 50.0 | Heavy traffic flow condition. Heavy delays probable. No available gaps for <br> cross-street traffic or main street turning traffic. Limited stable traffic flow. |
| F | $>50.0$ | Unstable traffic flow. Heavy congestion. Traffic moves in forced flow condition. <br> Average delays greater than one minute highly probable. Total breakdown. |

### 5.1 Existing Conditions

To determine how traffic currently operates in the study area, an operational analysis was conducted for the weekday morning and afternoon peak hours at the key intersections. Existing geometrics, traffic controls, and peak hour traffic volumes for the key intersections are shown in Figures 2.1 and 2.2. Level of service and queueing results for each turning movement at the analyzed intersections are shown in Table 5.3 for the weekday AM peak hour and Table 5.4 for the weekday PM peak hour. The traffic operations output files are in Appendix B.

The results of the existing-year traffic operations analysis indicate that all intersections currently operate at adequate levels of service (LOS D or better) with the exception of the intersections of WIS 81 with Sixth Street and with Woodward Avenue. During peak traffic periods, movements from the side streets (Sixth Street and Woodward Avenue) can experience longer delays due to infrequent gaps in the WIS 81 traffic stream not adequately allowing traffic to enter the intersection. This is not an uncommon situation in urban areas, especially when principal arterials such as WIS 81 intersect side streets under stop-sign control. As traffic volumes increase at this location, consideration should be given to identify geometric improvements that will mitigate these deficiencies at this location.

### 5.2 Year 2047 Conditions, No Build

To determine if the existing roadway system will accommodate Year 2047 traffic volumes, a peak hour operations analysis was conducted that evaluated the existing intersection geometry, lane configuration, and control with forecasted Year 2047 peak hour volumes. Analysis outputs are illustrated in Table 5.5 (weekday morning peak hour) and Table 5.6 (weekday afternoon peak hour). Traffic operations output files for this scenario are provided in Appendix C.

The Year 2047 traffic volumes were projected using the following methodologies:

- Year 2022 intersection turning movement counts collected for this study was submitted to WisDOT Traffic Forecasting Section (TFS) and Year 2047 traffic projections were created. WisDOT TFS develops traffic projections by reviewing the Beloit travel demand model and applies growth rates along WIS 81 and side-streets to the turning movements. These traffic projections are provided in Appendix D.
- Peak-hour traffic for planned / proposed developments were developed using trip generation rates published in the ITE Trip Generation Manual. The following developments were included in the traffic projections:
- Brassworx: a proposed mixed-use development of existing parcels is generally bounded by Merrill Street, Third Street, Portland Avenue, and Fourth Street. At the time of this study, a general site plan was not developed so it was assumed that 200 residential apartments and 60,000 square feet of retail space would occupy this site.
- Beloit Memorial High School: a 2018 traffic study discussed expansion of the high school, which assumed the construction of a new welcome and resource center and new sports fields within the campus.
- ABC Supply: a 2018 traffic study evaluated the expansion of the ABC Supply campus site, which included the addition of 160,000 square feet of office space to the existing site.

The peak-hour traffic projections for the planned / proposed developments were added to Year 2047 traffic projections provided by WisDOT TFS to create a volume data set used to evaluate the existing geometrics and intersection control. The Year 2047 peak-hour intersection turning movement counts are illustrated in Figure 5.1.

Future-Year (Year 2047) Peak-Hour Intersection Volumes

The results of the existing-year traffic operations analysis indicate that most intersections will continue to operate at adequate levels of service (LOS D or better). The intersections of WIS 81 with Sixth Street and with Woodward Avenue are anticipated to have movements operate at LOS E or LOS F, which is expected given that these locations currently have operational deficiencies. In addition, the intersection of WIS 81 and Wisconsin Avenue is also projected to have LOS E operations along Wisconsin Avenue. This is due to movements from Wisconsin Avenue experiencing longer delays due to infrequent gaps in the WIS 81 traffic stream not adequately allowing traffic to enter the intersection.

### 6.0 Alternatives Evaluation

Chapter 3.0 highlighted geometric deficiencies and crash patterns in the study area that could create safety issues. Chapter 5 indicated that several intersections currently, and are anticipated to, experience operational deficiencies during peak-hour traffic periods. Therefore, alternatives were developed that address these issues while maintaining favorable safety, mobility, access, and multimodal accommodations. These alternatives, and their evaluation, are provided below.

### 6.1 Corridor Improvements

### 6.1.1 Liberty Avenue (WIS 213 to Fourth Street)

## Alternative 1: Add pavement markings to more clearly define roadway features

The current roadway cross-section of Liberty Avenue is approximately 40 to 42 feet. This width provides 20 to 21 feet for each direction. This dimension is typically too small for two travel lanes but too wide for one travel lane. It is possible that motorists may mistakenly use this wide, single roadway lane as two lanes and attempt to pass slower-moving vehicles, increasing driver expectancy and crash risk. Providing pavement markings, such as lane lines, will guide motorists through the corridor (the roadway would maintain one travel lane in each direction) and inform them where features such as on-street parking or exclusive turn lanes are located.

Advantages

- Increased safety for motorists by clearly defining travel on the roadway
- Clearly defines roadway features such as parking lanes and turn lanes
- Minimal construction costs to implement
- No roadway widening necessary to implement

## Disadvantages

- Pavement markings can be disregarded by traveling public
- Does not aid in multi-modal accommodations along roadway
- May not aid in long-term mobility of roadway

## Alternative 2: Update cross-section to provide two travel lanes and on-street bike lanes

This alternative would maintain the existing roadway cross-section of two, 12 -foot travel lanes (one in each direction) but provide six-foot, on-street bike lanes in each direction. The inclusion of the bicycle lanes would provide a dedicated route for bike travel in western Beloit, connecting the high school campus and the north-south multi-use path at Fifth Street to the residential neighborhoods on the west side of the city.

| Advantages | Disadvantages |
| :---: | :---: |
| - Increased safety for motorists by clearly | -Pavement markings can be disregarded by <br> traveling public <br> defining travel on the roadway |
| - Provides dedicated bicycle route for users | -Removes on-street parking areas along <br> Liberty Avenue |
| Minimal construction costs to implement | -May create mobility issues along Liberty <br> implement widening necessary to |
|  | Avenue due to the loss of exclusive turn <br> lanes |
|  | -On-street bicycle lanes and high-volume <br> roadways (like Liberty Avenue) increases <br> risk exposure for vehicle-bicycle crashes |
|  |  |

## Alternative 3: Update cross-section to provide three travel lanes and a multi-use path

This alternative would update the existing roadway cross-section of two travel lanes (one in each direction) to a three-lane cross-section with a 12 -foot, two-way left-turn lane (TWLTL) separating 12 -foot through lanes. The inclusion of a TWLTL will improve safety and mobility by allowing left-turning vehicles to or from Liberty Avenue to use the TWLTL to store before completing their turn movement. This, in turn, allows through movements to continue along Liberty Avenue without interruptions from left-turning vehicles blocking the through lane.

In addition, a 10 -foot multi-use path would be provided along one side of the roadway (it is unknown at this time which side of Liberty Avenue would have this path). Similar to the previously discussed bike lanes, this path will provide a well-defined travel route for bicyclists and pedestrians connecting western Beloit to the high school campus and downtown areas.

## Advantages

## Disadvantages

- Increased safety and mobility for motorists by moving left-turning vehicles away from through lanes
- Provides dedicated bike/ped route for users
- Minimal construction costs and no roadway widening needed to implement three-lane cross-section
- Multi-use path can be accommodated with roadway right of way
- Removes on-street parking areas along Liberty Avenue
- Terrace between roadway and sidewalk may be reduced or removed to accommodate multi-use path

## Alternative 4: Implement access management strategies

Section 3.1 stated that an access review of Liberty Avenue found 85 access points from WIS 213 to Fourth Street, an access density of 94 access points per mile. This high access density can increase congestion and crash risk as motorists have numerous locations to enter and exit the WIS 81 corridor. This alternative would implement access management strategies that would reduce the amount of access along WIS 81. For private driveways, this would include consolidation, cross-access between parcels, turn movement restriction, and/or their removal. Public roadway access typically involves restriction or removal of access to the major route (WIS 81).
No existing private driveways were recommended for access management at this time as it is unknown if reasonable access to any affected parcels can be provided. Rather, this alternative would be considered as development or redevelopment of parcels is proposed along Liberty Avenue. For public roadways, candidate locations were considered for implementation, but will require further evaluation to determine their feasibility. One such combination of access management involves the restriction (e.g., right-in, right-out access) or removal of access at Moore Street, 10th Street, 8th Street, and Oak Street. These candidate roadways are at least two blocks from each other, allowing affected traffic to divert one block to the next full access roadway with Liberty Avenue. Access management for public roadways may increase the ability to provide elements that enhance bike/ped crossing of Liberty Avenue, such as the installation of refuge islands, additional signage, and beacon/lighting elements. By restricting or removing leftturn or through movements, these devices can be installed without potentially impeding on the affected turn movements.

## Disadvantages

- Increased safety and mobility for motorists by reducing the number of access points along Liberty Avenue
- Minimal construction costs needed to implement
- No roadway widening needed to implement
- Residents and motorists on affected roadways would travel to adjacent streets for access to/from Liberty Avenue
- Increased delays may occur on remaining full-access side-streets due to increase in diverted traffic using these roadways

### 6.1.2 Fourth Avenue (Portland Avenue to WIS 213)

The current roadway cross-section of Fourth Street is undivided with four travel lanes. The inside travel lanes typically serve as de facto turn lanes for motorists turning left from Fourth Street. In addition, northbound Fourth Street provides a "trapping left" condition as the inside through lane becomes a left-turn lane at Liberty Avenue. These situations can increase crash risk due to unexpected lane changes from the inside lanes and increased congestion as motorists may not want to drive in the inside lanes due to left-turning vehicles and the trapping left conditions. Converting the four-lane cross-section to a three-lane cross-section (two travel lanes and a TWLTL) would maintain mobility along Fourth Street while providing refuge for left-turning vehicles to and from the roadway. In addition, an on-street parking lane would be provided on the east side of Fourth Street to increase the parking supply in the area. The addition of the parking lane allows the existing roadway cross-section to be utilized without moving the curbs to accommodate the new cross-section elements.

## Advantages

- Increased safety and mobility for motorists by moving left-turning vehicles away from through lanes
- Provides increased parking supply in area
- Minimal construction costs and no roadway widening needed to implement three-lane cross-section
- No roadway widening needed to implement on-street parking lane

Disadvantages

- Increases vehicle / parked vehicle interactions at parking lane
- No multi-modal improvements provided along Fourth Street

### 6.1.3 White Avenue (Park Avenue to Milwaukee Road)

## Alternative 1: Provide multi-use path

The current roadway cross-section of White Avenue is approximately 28 to 30 feet. This crosssection, and its limited right of way, restricts the ability to improve mobility along White Avenue. In addition, the ability to continue the existing bike lanes that terminate at Harrison Avenue are limited without roadway widening and/or right of way acquisition. This alternative would replace a sidewalk with a multi-use path (it is unknown which side this path would be located) that would connect the existing bike lanes at Harrison Avenue with a proposed multi-use path east of Milwaukee Road. This improvement would provide a vital bike/ped route connecting the residential neighborhoods and commercial areas of eastern Beloit and the downtown area.

Advantages

## Disadvantages

- Does not address mobility or safety issues of motorists along White Avenue
- Provides dedicated bike/ped route for users
- Terrace between roadway and sidewalk may be reduced or removed to accommodate multi-use path
- Improvement can be accommodated within existing right of way

## Alternative 2: Update cross-section to provide three travel lanes

This alternative would update the existing roadway cross-section of two travel lanes (one in each direction) to a three-lane cross-section with a 12 -foot, two-way left-turn lane (TWLTL) separating 12 -foot through lanes. The inclusion of a TWLTL will improve safety and mobility by allowing left-turning vehicles to or from White Avenue to use the TWLTL to store before completing their turn movement. This, in turn, allows through movements to continue along White Avenue without interruptions from left-turning vehicles blocking the through lane. This alternative would not provide a multi-use path and maintain the existing sidewalks.

## Advantages

## Disadvantages

- Increased safety and mobility for motorists by moving left-turning vehicles away from through lanes
- Significant construction costs to implement
- Terrace between roadway and sidewalk may be reduced or removed to accommodate improvement
- Bike/ped accommodations not improved with this alternative

Alternative 3: Update cross-section to provide three travel lanes and a multi-use path
This alternative is a combination of Alternative 1 and Alternative 2 which would provide a threelane roadway cross-section of White Avenue as well as a multi-use path for bike/ped use.

## Advantages

- Increased safety and mobility for motorists by moving left-turning vehicles away from through lanes
- Provides dedicated bike/ped route for users

## Disadvantages

- Significant construction costs to implement
- Possible right of way needed to implement
- Terrace between roadway and sidewalk may be reduced or removed to accommodate multi-use path

## Alternative 4: Implement access management strategies

Section 3.1 stated that an access review of White Avenue found 62 access points from Harrison Avenue to Milwaukee Road, an access density of 100 access points per mile. This high access density can increase congestion and crash risk as motorists have numerous locations to enter and exit the WIS 81 corridor. This alternative would implement access management strategies that would reduce the amount of access along White Avenue. For private driveways, this would include consolidation, cross-access between parcels, turn movement restriction, and/or their removal. Public roadway access typically involves restriction or removal of access to the major route (WIS 81).

No existing private driveways were recommended for access management at this time as it is unknown if reasonable access to any affected parcels can be provided. Rather, this alternative would be considered as development or redevelopment of parcels is proposed along White Avenue. For public roadways, candidate locations were considered for implementation, but will require further evaluation to determine their feasibility. One such combination of access management involves the restriction (e.g., right-in, right-out access) or removal of access at Harrison Avenue, Wisconsin Avenue, Nelson Avenue, Central Avenue, Eaton Avenue, and Hinsdale Avenue. These candidate roadways are at least two blocks from each other, allowing affected traffic to divert one block to the next full access roadway with White Avenue. Access management for public roadways may increase the ability to provide elements that enhance bike/ped crossing of White Avenue, such as the installation of refuge islands, additional signage, and beacon/lighting elements. By restricting or removing left-turn or through movements, these devices can be installed without potentially impeding on the affected turn movements.

- Increased safety and mobility for motorists by reducing the number of access points along White Avenue
- Minimal construction costs needed to implement
- No roadway widening needed to implement

Disadvantages

- Residents and motorists on affected roadways would travel to adjacent streets for access to/from White Avenue
- Increased delays may occur on remaining full-access side-streets due to increase in diverted traffic using these roadways

### 6.2 Intersection Improvements

### 6.2.1 Liberty Avenue and Bluff Street and Sixth Street

This improvement would change the intersection control at these intersections so that Sixth Street is under traffic signal control while Bluff Street would become a two-way stop-control (TWSC) intersection. Sixth Street is a higher functionally classified roadway, carries more peak-hour and daily traffic, and has a greater benefit to the Beloit Memorial High School campus traffic; therefore, upgrading the intersection control to a traffic signal will provide dedicated green time for movements to and from Sixth Street.

## Advantages

Disadvantages

- Traffic signal serves higher classification, higher-volume roadway
- Improves safety and mobility by providing dedicated green time to and from Sixth Street
- Provides another access to Liberty Avenue via traffic signal for Beloit Memorial High School campus traffic
- No/minimal right of way needed to implement
- Increased delays along Bluff Street likely due to stop control
- Potential increases in traffic along Sixth Street due to diverted Bluff Street traffic

Traffic operations analysis was performed for Year 2047 conditions with the change in intersection control, with its results illustrated below:

| Intersection | Overall |  | By Approach | Eastbound |  |  | Westbound |  |  | Northbound |  |  | Southbound |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

The results indicate that Sixth Street, as a traffic signal, will operate adequately during peak-hour conditions while Bluff Street, as two-way stop control, will experience long delays on the sidestreet due to limited gaps in the WIS 81 traffic stream. It should be noted that no diversion of traffic from Bluff Street to Sixth Street was assumed so a "worst-case" condition was analyzed; it is likely that many left-turn and through movements will use the traffic signal at Sixth Street. In addition, when traffic along WIS 81 is stopped at Sixth Street, side-street traffic at Bluff Street may be provided additional gaps to complete their turning movement, improving operations.

### 6.2.2 Liberty Avenue and Fifth Street

The intersection of Liberty Avenue and Fifth Street is located approximately 250 feet east of Sixth Street and approximately 250 feet west of Fourth Street. With Fourth Street currently signalized and Sixth Street recommended to become signalized, the provision of an unsignalized intersection so close to these signalized locations may create mobility and safety concerns. To mitigate this situation, Fifth Street access would be restricted (right-in, right-out only) or removed at Liberty Avenue to reduce the number of conflict points at this intersection and between the two traffic signals. The multi-use path would remain at this intersection.

## Advantages

Disadvantages

- Improves safety by reducing conflict points along this section of Liberty Avenue
- Improves mobility by eliminating left-turns and through movements at intersection
- Reduces cut-through traffic to/from high school
- No/minimal right of way needed to implement
- Maintains and allows for enhancements of multi-use path crossing at Liberty Avenue
- Residents and businesses along Fifth Street will be diverted to other roadways
- Potential increases in traffic along Fourth and Sixth Streets due to diverted Fifth Street traffic

### 6.2.3 Liberty Avenue and Fourth Street

## Alternative 1: Remove east leg from intersection

This alternative would remove the east (Liberty Avenue) leg from the existing intersection, converting it to a T-intersection. The existing roadway would remain for access to adjacent properties.

## Advantages

- Increased mobility by removing traffic movements to/from east leg and reallocates green time for traffic signal
- Increased safety by reducing number of conflict points at intersection
- Potential sidewalk enhancement on east side of intersection due to roadway removal
- Minimal construction costs to implement

## Disadvantages

- Does not address "trapping left" condition for northbound traffic (if Fourth Street maintains four-lane cross-section)
- Does not address improving turning capabilities for movements along WIS 81 corridor
- Removes the only signalized access to Fourth Street for properties on east side of roadway, including Brassworx development

## Alternative 2: Convert north leg to one-way northbound traffic only

This alternative would convert the north leg (Fourth Street) from two-way to one-way northbound from the existing intersection. Existing southbound traffic would be diverted to other roadways, such as Sixth Street, for travel.

## Disadvantages

- Increased mobility by removing traffic movements to/from north leg and reallocates green time for traffic signal
- Increased safety by reducing number of conflict points at intersection
- Provides streamlined traffic flow into high school campus area
- Minimal construction costs to implement
- Does not address "trapping left" condition for northbound traffic (if Fourth Street maintains four-lane cross-section)
- Does not address improving turning capabilities for movements along WIS 81 corridor
- Likely increases traffic to Fifth and Sixth Streets due to diverted southbound traffic

## Alternative 3: Update intersection control to a roundabout

This alternative would convert the existing signalized intersection to a roundabout. The roundabout would have single-lane approaches on the north and east legs and two-lane approaches on the south and west legs. Raised splitter islands would separate the travel lanes on each approach and a mountable truck apron would be present to accommodate truck movements.

## Advantages

- Increased mobility by making all intersection movements yield control
- Increased safety by eliminating angle and head-on crash potential
- Splitter islands provide two-stage crossing for bike/ped traffic
- Design maintains truck turning capabilities at intersection

## Disadvantages

- Does not address "trapping left" condition for northbound traffic (if Fourth Street maintains four-lane cross-section)
- Significant construction costs and right of way acquisition to implement

This alternative would reconstruct the intersection to align the south and west (WIS 81) intersection legs to make through movements the "major" movement at the intersection. The north leg would intersect the realigned legs, forming a T -intersection that would be signalized. The east leg would be realigned to the north and intersect the north leg away from the newly formed T-intersection to provide spacing between the intersections.

## Disadvantages

- Increased mobility by realigning south and west legs and reallocating green time for traffic signal
- Increased safety by reducing number of conflict points at intersection
- Approach realignment makes truck travel easier as they are now through movements through the intersection
- Potential sidewalk enhancement on east side of intersection due to roadway removal
- Significant right of way needed to implement
- Significant construction costs to implement
- Fifth Street access must be restricted or removed due to horizontal alignment change

The existing intersection is located within a transition area of WIS 81 where the existing four lanes west of the intersection is reduced to two travel lanes east of US 51. The lane reduction for eastbound WIS 81 traffic is performed by creating a "trapping right" turn lane at Woodward Avenue, located approximately 250 feet east of US 51. This condition impacts traffic flow for eastbound WIS 81 traffic at US 51 as poor lane utilization (to avoid the trapping right at Woodward Avenue) and queue-jumping (aggressive drivers attempting to avoid long queues by speeding and merging suddenly) creates safety and mobility concerns. The intersection geometrics for the left-turn lanes on WIS 81 also provides a negative left-turn offset which can block field of vision and increase crash risk. To mitigate these deficiencies, the eastbound approach of the intersection would be reduced from two through lanes to one through lane to eliminate the trapping right situation downstream. The elimination of the second eastbound through lane would allow the westbound left-turn lane to be shifted southerly to improve the leftturn offset for the eastbound and westbound left-turn lanes.

## Advantages

- Increased safety for eastbound motorists by eliminating trapping right and queuejumping conditions downstream
- Increased safety for eastbound/westbound left-turn lanes by improving left-turn offset
- Improvements can be accommodated within existing roadway footprint
- Median in southwest quadrant could provide two-stage crossing

Disadvantages

- Eastbound merge for WIS 81 will occur further back, possibly on the Rock River bridge
- Increased delays at intersection possible due to loss of eastbound through lane and reallocation of green time

Traffic operations analysis was performed for Year 2047 conditions with the change in intersection control, with its results illustrated below:

| Intersection | Overall |  | By Approach | Eastbound |  |  | Westbound |  |  | Northbound |  |  | Southbound |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Delay (s) | LOS |  | EBL | EBT | EBR | WBL | WBT | WBR | NBL | NBT | NBR | SBL | SBT | SBR |
| WIS 81 \& US 51, AM Peak Hour | 22.2 | C | Lane Configuration | 1 | 1 | 1 | 1 | 2> | - | 1 | 2> | - | 1 | 2> | - |
|  |  |  | Volume | 205 | 525 | 45 | 40 | 470 | 40 | 40 | 260 | 75 | 70 | 215 | 175 |
|  |  |  | Delay (s) | 12.8 | 25.4 | 12.8 | 14.5 | 4.2 | - | 27.6 | 34.8 | - | 27.3 | 36.0 | - |
|  |  |  | LOS | B | C | B | B | A | - | C | C | - | C | D | - |
|  |  |  | V/C Ratio | 0.44 | 0.74 | 0.04 | 0.15 | 0.41 | - | 0.22 | 0.60 | - | 0.31 | 0.69 | - |
|  |  |  | 95\% Queue (ft) | 120 | 415 | 20 | 20 | 45 | - | 40 | 180 | - | 65 | 215 | - |
| WIS 81 \& US 51, PM Peak Hour | 23.0 | C | Lane Configuration | 1 | 1 | 1 | 1 | 2> | - | 1 | 2> | - | 1 | 2> | - |
|  |  |  | Volume | 190 | 595 | 45 | 75 | 690 | 80 | 55 | 300 | 60 | 65 | 320 | 235 |
|  |  |  | Delay (s) | 12.6 | 29.8 | 13.6 | 16.6 | 8.6 | - | 23.7 | 28.6 | - | 22.4 | 36.5 | - |
|  |  |  | LOS | B | C | B | B | A | - | C | C | - | C | D | - |
|  |  |  | V/C Ratio | 0.44 | 0.81 | 0.04 | 0.29 | 0.60 | - | 0.26 | 0.44 | - | 0.21 | 0.74 | - |
|  |  |  | 95\% Queue (ft) | 95 | 465 | 15 | 40 | 95 | - | 40 | 160 | - | 45 | 225 | - |

The results of the traffic operations analysis indicate that all traffic movements are anticipated to operate at LOS D or better during peak traffic periods. It should be noted that longer queues are projected on the eastbound approach with one through lane; however, these queues would not interfere with traffic operations at upstream intersections.

### 6.2.5 White Avenue and Woodward Avenue

## Alternative 1: Provide right-in, right-out access only

The unsignalized intersection of White Avenue and Woodward Avenue is located approximately 250 feet from the signalized US 51 intersection. This close intersection spacing can increase congestion and crash risk due to the increased number of conflict points over a short distance. This alternative would convert the full access intersection to right-in, right-out access only. An eastbound right-turn lane would be provided to allow right-turning vehicles to move out of the through traffic stream (this provision assumes that improvements to the US 51 intersection will be implemented). A raised median would be constructed along White Avenue prohibiting left-turns at the intersection from occurring.

Advantages

- Improves safety by reducing conflict points at intersection
- Improves mobility by eliminating left-turns at intersection
- No right of way needed to implement
- Minimal construction costs to implement
- Maintains bike/ped movements at intersection
- Affects minor amount of left-turning traffic (max. 50 vehicles per hour)

Disadvantages

- Existing left-turning traffic will divert to Park Avenue intersection
- Increased travel time and distance for diverted left-turning traffic

## Alternative 2: Remove access to/from Woodward Avenue

This alternative would eliminate the Woodward Avenue intersection entirely. Bicyclists and pedestrians would still have infrastructure to travel from either roadway.

## Advantages

## Disadvantages

- Improves safety by eliminating intersection
- Improves mobility by eliminating intersection
- No right of way needed to implement
- Minimal construction costs to implement
- Maintains bike/ped movements at intersection
- Existing Woodward Avenue traffic will divert to Park Avenue intersection
- More traffic affected with this alternative due to right-turning traffic now diverted
- Increased travel time and distance for diverted traffic and emergency vehicles

Alternative 3: Remove Woodward Avenue access and add new access at Prince Hall Drive
This alternative would eliminate the Woodward Avenue intersection entirely and construct a new roadway that would connect from Woodward Avenue or Church Street with White Avenue via the existing signalized intersection with Prince Hall Drive. This roadway extension would create a fourth leg at the Prince Hall Drive intersection.

## Advantages

- Improves safety by eliminating intersection
- Improves mobility by eliminating intersection
- Roadway extension minimizes diverted travel distance and travel time
- Increases emergency vehicle circulation at existing fire station on Church Street
- Maintains bike/ped movements at intersection

## Disadvantages

- Significant construction costs and right of way acquisition to implement
- Increased delay along White Avenue likely due to fourth leg added at Prince Hall Drive signalized intersection

### 6.2.6 White Avenue and Park Avenue

The signalized intersection of White Avenue and Park Avenue is anticipated to experience LOS D for numerous intersection lane groups under Year 2047 conditions. This, coupled with the existing crash commonalities and negative left-turn offset along White Avenue, will compound the existing crash risk at this location. To mitigate these concerns, the intersection would be converted from traffic signal control to roundabout control. Single-lane approaches would be provided at each intersection leg. Raised splitter islands would separate the travel lanes on each approach and a mountable truck apron would be present to accommodate truck movements.

Advantages

## Disadvantages

- Significant construction costs to implement
- Increased mobility by making all intersection movements yield control
- Increased safety by eliminating angle and head-on crash potential
- Splitter islands provide two-stage crossing for bike/ped traffic
- Aids in reducing travel speeds at intersection
- Can be accommodated within existing right of way

Traffic operations analysis was performed for Year 2047 conditions with the change in intersection control, with its results illustrated below:

| Intersection | Overall |  | By Approach | Eastbound |  |  | Westbound |  |  | Northbound |  |  | Southbound |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Delay (s) | LOS |  | EBL | EBT | EBR | WBL | WBT | WBR | NBL | NBT | NBR | SBL | SBT | SBR |
| WIS 81 \& Park Avenue, AM Peak Hour | 11.3 | B | Lane Configuration | - | <1 | 1 | - | <1> | - | - | <1> | - | - | <1> | - |
|  |  |  | Volume | 60 | 380 | 5 | 20 | 500 | 70 | 105 | 165 | 20 | 45 | 115 | 130 |
|  |  |  | Delay (s) | - | 7.7 | - | - | 15.0 | - | - | 9.1 | - | - | 11.6 | - |
|  |  |  | LOS | - | A | - | - | C | - | - | A | - | - | B | - |
|  |  |  | V/C Ratio | - | 0.43 | - | - | 0.68 | - | - | 0.39 | - | - | 0.45 | - |
|  |  |  | 95\% Queue (ft) | - | 55 | - | - | 140 | - | - | 45 | - | - | 60 | - |
| WIS 81 \& Park Avenue, PM Peak Hour | 13.6 | B | Lane Configuration | - | <1 | 1 | - | <1> | - | - | <1> | - | - | <1> | - |
|  |  |  | Volume | 120 | 535 | 45 | 20 | 520 | 65 | 45 | 185 | 55 | 55 | 190 |  |
|  |  |  | Delay (s) | - | 13.0 | - | - | 15.1 | - | - | 12.3 | - | - | 13.1 | - |
|  |  |  | LOS | - | B | - | - | C | - | - | B | - | - | B | - |
|  |  |  | V/C Ratio | - | 0.67 | - | - | 0.68 | - | $-$ | 0.46 | - | - | 0.54 | - |
|  |  |  | 95\% Queue (ft) | - | 135 | - | - | 140 | - | - | 60 | - | - | 85 | - |

The results of the traffic operations analysis indicated that the roundabout control is projected to operate adequately during peak traffic conditions.

### 6.2.7 White Avenue and Milwaukee Road

## Alternative 1: Update intersection control to a roundabout

The unsignalized intersection of White Avenue and Milwaukee Road is currently located along a horizontal curve and at a transitional area of WIS 81 from residential neighborhood and commercial center. Crash history and public comment at this intersection cite that WIS 81 westbound motorists are approaching this intersection at high travel speeds which increases crash risk at the intersection, particularly run-off-road crashes. In addition, the geometry and travel speeds at this intersection make bicycle and pedestrian travel uncomfortable (a crosswalk previously located on the west side of the intersection was removed due to these conditions). To mitigate these concerns, the intersection would be converted from two-way stop control to roundabout control. Single-lane approaches would be provided at each intersection leg. Raised splitter islands would separate the travel lanes on each approach and a mountable truck apron would be present to accommodate truck movements.

Advantages

- Increased mobility by making all intersection movements yield control
- Increased safety by eliminating angle and head-on crash potential
- Splitter islands provide two-stage crossing for bike/ped traffic
- Aids in reducing travel speeds at intersection

Traffic operations analysis was performed for Year 2047 conditions with the change in intersection control, with its results illustrated below:

| Intersection | Overall |  | By Approach | Eastbound |  |  | Westbound |  |  | Northbound |  |  | Southbound |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Delay (s) | LOS |  | EBL | EBT | EBR | WBL | WBT | WBR | NBL | NBT | NBR | SBL | SBT | SBR |
| WIS 81 \& Milwaukee Road | 7.5 | A | Lane Configuration | - | 1> | - | - | <1 | - | - | <1> | - | - | - | - |
|  |  |  | Volume | - | 430 | 55 | 95 | 445 | - | 65 | - | 110 | - | - | - |
|  |  |  | Delay (s) | - | 7.5 | - | - | 7.8 | - | - | 6.6 | - | - | - | - |
|  |  |  | LOS | - | A | - | - | A | - | - | A | - | - | - | - |
|  |  |  | V/C Ratio | - | 0.44 | - | - | 0.47 | - | - | 0.23 | - | - | - | - |
|  |  |  | 95\% Queue (ft) | - | 60 | - | - | 65 | - | - | 25 | - | - | - | - |
| WIS 81 \& Milwaukee Road | 8.7 | A | Lane Configuration | - | 1> | - | - | <1 | - | - | <1> | - | - | - | - |
|  |  |  | Volume | - | 495 | 30 | 135 | 475 | - | 25 | - | 150 | - | - | - |
|  |  |  | Delay (s) | - | 9.4 | - | - | 8.5 | - | - | 7.5 | - | - | - | - |
|  |  |  | LOS | - | A | - | - | A | - | - | A | - | - | - | - |
|  |  |  | V/C Ratio | - | 0.53 | - | - | 0.53 | - | - | 0.25 | - | - | - | - |
|  |  |  | 95\% Queue (ft) | - | 80 | - | - | 80 | - | - | 25 | - | - | - | - |

The results of the traffic operations analysis indicated that the roundabout control is projected to operate adequately during peak traffic conditions.

## Alternative 2: Provide on-street improvements to intersection

This alternative would provide numerous roadway and intersection improvements to the intersection, listed below:

- Reduce the number of travel lanes along Milwaukee Road (east approach) from four to two east of the at-grade railroad crossing
- Construct raised medians along WIS 81 near the Milwaukee Road intersection
- Install speed limit feedback signs along WIS 81 to inform and alert motorists of their current travel speed approaching the intersection
- Install a crosswalk on the west side of the intersection and install advanced warning and crosswalk features (e.g., signs, beacons, etc.) informing motorists of the crosswalk
- Construct a protected, multi-use path on the south side of WIS 81, east of the Milwaukee Road intersection

## Advantages

## Disadvantages

- Signs and markings can be disregarded by motorists
- Increased safety by reducing travel speed
- Raised median island provides two-stage crossing for bike/ped traffic
- Can be accommodated within existing roadway cross-section and right of way
- Can be installed as separate items of together at once
- Does not physically make motorists reduce speeds (i.e., horizontal deflection of a roundabout)

### 7.0 Recommendations

Alternatives for the WIS 81 corridor were developed based on deficiencies found in the following categories: geometric site reviews of the study area, safety evaluation of the WIS 81 corridor and the study intersections, and intersection operations analysis for the existing-year and Year 2047 horizon year. Locations with several alternatives were evaluated based on the aforementioned categories and a preferred alternative was selected based on those results.

The following describes recommendations for the WIS 81 corridor and key intersections:

## WIS 81 (Liberty Avenue), Madison Road to Fourth Street

- It is recommended that the Liberty Avenue cross-section be updated to provide a threelane cross-section (two travel lanes and a TWLTL) with a multi-use path replacing one sidewalk. This alternative improves both safety and mobility as the TWLTL will allow left-turning vehicles to store and complete their turning movement to and from Liberty Avenue. The multi-use path will enhance bike/ped accommodations along the corridor and provide a vital east-west route connecting western Beloit to the downtown area. These improvements can be accommodated within the existing roadway cross-section and right of way, minimizing construction costs and right of way acquisition.
- It is recommended that access management strategies are considered for implementation along the Liberty Avenue corridor. Strategies such as consolidation, cross-access, restriction, or removal of access to Liberty Avenue will improve safety and mobility by reducing the number of access drives and conflict points which motorists must consider when driving along the roadway. Restriction or removal of public roadway access to Liberty Avenue should be investigated further to determine candidate locations. If locations are determined, crossing elements at these restricted intersections should be implemented to improve bike/ped safety when crossing Liberty Avenue.

WIS 81 (Liberty Avenue), Sixth Street intersection

- It is recommended that the intersection control at Sixth Street be updated to provide traffic signal control (via shifting the traffic signal control from Bluff Street to Sixth Street). This improvement will provide protected green time to traffic to and from Sixth Street instead of waiting for gaps in Liberty Avenue traffic, improving safety and mobility at the intersection. Shifting the traffic signal to the east will also help serve traffic to and from Beloit Memorial High School, providing better distribution of traffic from the campus. While the Sixth Street traffic signal is approximately 570 feet from the existing traffic signal at Fourth Street, traffic signal phasing and timing can be coordinated to provide efficient traffic flow along Liberty Avenue with no queues spilling back to the upstream intersection.

## WIS 81 (Liberty Avenue), Fifth Street intersection

- It is recommended that the Fifth Street intersection be restricted (right-in, right-out access only) or removed at Liberty Avenue. This access management will aid in safety and mobility along Liberty Avenue by removing a full-access intersection between two closely-spaced traffic signals as well as reduce cut-through traffic to and from Beloit

Memorial High School. This improvement also provides an opportunity to enhance the existing multi-use path crossing at Liberty Avenue, improving safety and comfort for bicyclists and pedestrians that use it.

## WIS 81 (Liberty Avenue), Fourth Street intersection

- It is recommended that, in the short-term, to maintain the existing intersection geometrics and intersection control (i.e., no-build condition). The existing intersection is anticipated to operate adequately (LOS D or better) during Year 2047 peak-hour conditions and the traffic signal will continue to provide dedicated green time for bikes/peds traveling to and from the high school.
- It is recommended that, as a long-term strategy, the intersection of Liberty Avenue and Fourth Street be realigned so the south and west legs (WIS 81) serve as the "through" movement. While this alternative has the largest impacts to the surrounding areas and is the most complex to implement, this alternative provides the greatest benefit to the intersection as it increases mobility along WIS 81 by making two adjacent intersection legs the "through" movement, allowing green time to be more efficiently allocated. Trucks and other large vehicles traveling along WIS 81 will become through movements in the area and not have to perform tight turns at this intersection. The traffic signal will remain in-place, which will provide bike/ped traffic dedicated signal time to cross WIS 81 unopposed.
- If the horizontal curve alternative is determined to be not feasible for implementation, the roundabout alternative should be considered. While impacts to surrounding parcels are likely, they are not as significant as the horizontal curve alternative. The roundabout is anticipated to provide adequate traffic operations while eliminating angle and head-on crashes due to the roundabout design. Splitter islands on all four quadrants will also allow bikes/peds to perform a two-stage crossing of a roadway.

## WIS 81 (Fourth Street), Liberty Avenue to Portland Avenue

- It is recommended that the Fourth Street cross-section be updated to provide a three-lane cross-section (two travel lanes and a TWLTL) with a parking lane. This alternative improves both safety and mobility as the TWLTL will allow left-turning vehicles to store and complete their turning movement to and from Fourth Street. In addition, the existing "trapping left" condition for northbound traffic at Liberty Avenue is eliminated with this improvement. The on-street parking lane will provide additional parking supply in the area, particularly as the Brassworx site develops. These improvements can be accommodated within the existing roadway cross-section and right of way, minimizing construction costs and right of way acquisition.

## WIS 81 (Portland Avenue), US 51 intersection

- It is recommended that the intersection of Portland Avenue with US 51 be updated to reduce the number of eastbound through lanes from two to one. This improvement will eliminate the downstream "trapping right" condition at Woodward Avenue as well as the upstream lane utilization and "queue-jumping" issues on eastbound WIS 81, significantly
improving safety in this area. Eliminating the second through lane will also allow the westbound left-turn lane to be shifted southerly so the left-turns at the intersection will create a positive left-turn offset, further improving safety at this location. It is anticipated that delays will increase with the reduction of roadway capacity for eastbound through movements, but LOS D or better operations are projected for all movements at this intersection. This alternative can be accommodated within the existing roadway crosssection and right of way, minimizing complexity to implement and associated costs.

## WIS 81 (White Avenue), Woodward Avenue intersection

- It is recommended that the White Avenue and Woodward Avenue intersection be restricted to right-turn in, right-turn out access only. This alternative eliminates lowervolume, left-turn movements at this intersection while maintaining the higher-volume, eastbound right-turn onto Woodward Avenue. Eliminating left-turn movements improves safety and mobility in the area by eliminating conflict points for WIS 81 motorists. This alternative can be implemented within the existing roadway cross-section.

## WIS 81 (White Avenue), Park Avenue intersection

- It is recommended that the White Avenue and Park Avenue intersection be updated from traffic signal control to roundabout control. This improvement will benefit safety by eliminating left-turn, angle, and head-on crashes due to the roundabout design and benefit mobility by providing yield control for motorists. The roundabout will reduce travel speeds at the intersection by forcing motorists to navigate around the roundabout median. The splitter islands will provide two-stage crossing for bicyclists and pedestrians. This improvement can be accommodated within the existing right of way.

## WIS 81 (White Avenue), Park Avenue to Milwaukee Road

- It is recommended that, in the short-term, to maintain the existing roadway cross-section (i.e., no-build condition). Most study intersections along this corridor are anticipated to operate at LOS D or better during Year 2047 conditions. In addition, discussions throughout the project with local stakeholders and residents raised concerns over the cost to widen the roadway cross-section, the potential loss of vegetation in the roadway terrace, and likely right of way acquisition to implement several alternatives favored maintaining the existing cross-section and right of way for as long as possible.
- To aid in maximizing the existing cross-section, it is recommended that access management strategies are considered for implementation along the White Avenue corridor. Strategies such as consolidation, cross-access, restriction, or removal of access to White Avenue will improve safety and mobility by reducing the number of access drives and conflict points which motorists must consider when driving along the roadway. Restriction or removal of public roadway access to White Avenue should be investigated further to determine candidate locations. If locations are determined, crossing elements at these restricted intersections should be implemented to improve bike/ped safety when crossing White Avenue.
- To aid in promoting bicycle use in eastern Beloit, it is recommended that bicycle routes parallel to White Avenue be promoted to connect the existing bike lanes and downtown Beloit with the eastern neighborhoods and commercial areas. Routes such as Keeler Avenue to the north and Woodward Avenue / Strong Avenue to the south provide long-distance parallel routes to White Avenue with significantly lower traffic volumes. In addition, bicycle-use elements, such as pavement markings or wayfinding signs can be installed along these parallel routes to promote their use by providing bicycle-centric features that add to the comfort level of using these routes.
- It is recommended that, as a long-term solution, the White Avenue cross-section be updated to provide a three-lane cross-section (two travel lanes and a TWLTL). This alternative improves both safety and mobility as the TWLTL will allow left-turning vehicles to store and complete their turning movement to and from White Avenue. Widening of the roadway cross-section will be necessary to implement this alternative so this improvement should be considered as part of a larger roadway reconstruction project that requires adjusting utilities beneath the roadway.

## WIS 81 (White Avenue), Wisconsin Avenue intersection

- It is recommended that intersection sight triangles be reviewed at this location and address any obstructions. This improvement will improve safety by providing clear and unobstructed sight triangles for both WIS 81 and Wisconsin Avenue traffic. In the event obstructions are present within a sight triangle, they should be removed or minimized (e.g., vegetation trimmed) as much as possible.
- A review of intersection crash data found many crashes at this intersection were the result of a through movement along Wisconsin Avenue being struck by a through movement along White Avenue. This implies that there are few adequate gaps in the White Avenue traffic stream and motorists along Wisconsin Avenue may become frustrated and accept smaller gaps to cross. Additionally, limited visibility at this intersection may compound this issue. In addition to clearing vision triangles to improve sight distance from Wisconsin Avenue, another potential solution would upgrade the intersection control, such as a roundabout. A roundabout would improve intersection safety and mobility as well as maintain adequate traffic flow along WIS 81 even though Wisconsin Avenue is located between the signalized intersections of Park Avenue and Prairie Avenue (approximately 1,500 feet apart). WIS 81 traffic flow would also operate adequately with a roundabout at this location even if the WIS 81 and Park Avenue intersection was converted to roundabout control. The roundabout alternative would require additional right-of-way for construction that would impact corner properties (and possibly buildings) adjacent to the intersection. This improvement could also divert traffic from adjacent arterials such as Park Avenue and Prairie Avenue and use Wisconsin Avenue, a residential local street, as a cut-through route to avoid the signalized intersections at WIS 81.

## WIS 81 (White Avenue), Milwaukee Road intersection

- Both alternatives, updating the intersection to a roundabout or installing numerous intersection improvements, improve safety by reducing travel speeds approaching and through the intersection. Both alternatives, also, address bicycle and pedestrian accommodations to cross White Avenue by providing two-stage crossing at the intersection. Both alternatives will provide adequate mobility for both White Avenue and Milwaukee Road traffic. Therefore, both alternatives would be beneficial to addressing the needs of the intersection. It is recommended, though, that the numerous intersection improvements be implemented at this location as these improvements can be constructed within the roadway cross-section and right of way. The roundabout alternative will likely require right of way to construct the circulation lanes and sidewalks around the intersection.

## Other recommendations

In addition to the recommendations previously discussed, there are other locations in the study area that would benefit from improvements, but the improvement is more systemic (e.g., reviewing traffic signal phasing / timing) or the improvement does not have a comparable alternative to evaluate against it. Therefore, the following describes other recommendations to improve safety, mobility, access, and multimodal accommodations along the WIS 81 corridor:

- It is recommended that crosswalk pavement markings be monitored and refreshed to maintain their visibility for motorists and bicyclists/pedestrians. In particular, the crosswalks at the Liberty Avenue and Fourth Street intersection should be updated due to its location near Beloit Memorial High School.
- It is recommended that crosswalks at unsignalized intersections east of US 51 be installed to provide a defined path for bicyclists/pedestrians crossing the side-street or WIS 81.
- It is recommended that the Liberty Avenue and Fifth Street intersection be enhanced with signing and marking to promote safer, more comfortable crossing for bicyclists and pedestrians using the multi-use path at this location.
- It is recommended that access management strategies near the Fourth Street and Portland Avenue intersection be employed as the proposed Brassworx site becomes developed. This improvement will allow for safe and efficient operations at the signalized intersection without impacting driveways or roadways nearby.
- It is recommended that traffic signal equipment is reviewed for improved visibility and clarity for motorists. Examples of this include inspecting and adding backplates (or retroreflective backplates) to each signal head, checking the placement of overhead signal heads over each through or turn lane, and examining the placement of each signal head to ensure that motorists can clearly see them without obstruction.
- It is recommended to provide signing and marking along Portland Avenue to connect the existing bike lanes to the Fifth Street multi-use path. Currently, the on-street bike lanes abruptly end at Fourth Street, one block east of the multi-use path, with no additional information about the path. Adding signing and marking along this one-block stretch of Portland Avenue will provide a vital connection for bicyclists traveling through the City of Beloit.
- It is recommended that intersection sight triangles be reviewed at unsignalized intersections along WIS 81 and address any locations with obstructions. Maintaining clear and unobstructed sight triangles improves safety for both WIS 81 and side-street traffic by providing sight lines for vehicles to see each other as they approach an intersection. Items such as vegetation, fences, lawn decorations, and utility poles can block the field of vision for a driver and increase crash risk due to approaching vehicles "hiding" behind objects. In the event obstructions are present within a sight triangle, they should be removed or minimized (e.g., vegetation trimmed) as much as possible.

## Intersection Summary

HCM 6th Ctrl Delay 2.7

HCM 6th LOS A

## Notes

User approved volume balancing among the lanes for turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.
